Conditional Generation by RNN & Attention

Hung-yi Lee

李宏毅

Outline

- Generation
- Attention
- Tips for Generation
- Pointer Network

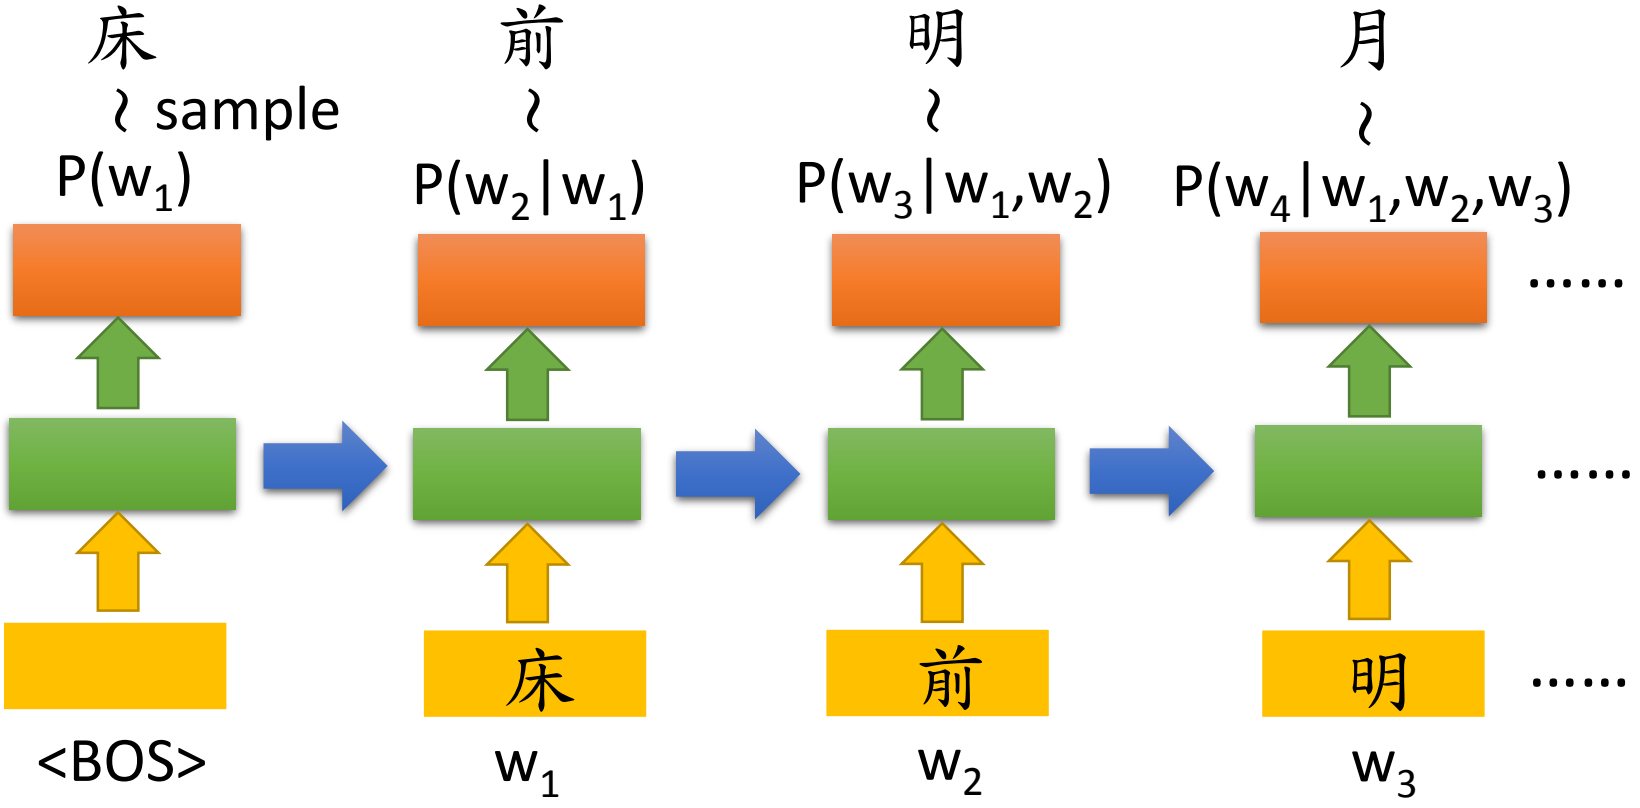
Generation

Generating a structured object component-by-component

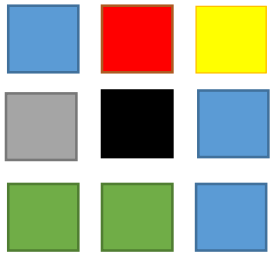
Generation

http://youtien.pixnet.net/blog/post/4604096-%E6%8E%A8%E6%96%87%E6%8E%A5%E9%BE%8D%E4%B9%8B%E5%B0%8D%E8%81%AF%E9%81%8A%E6%88%B2

- Sentences are composed of characters/words
  - Generating a character/word at each time by RNN



Generation

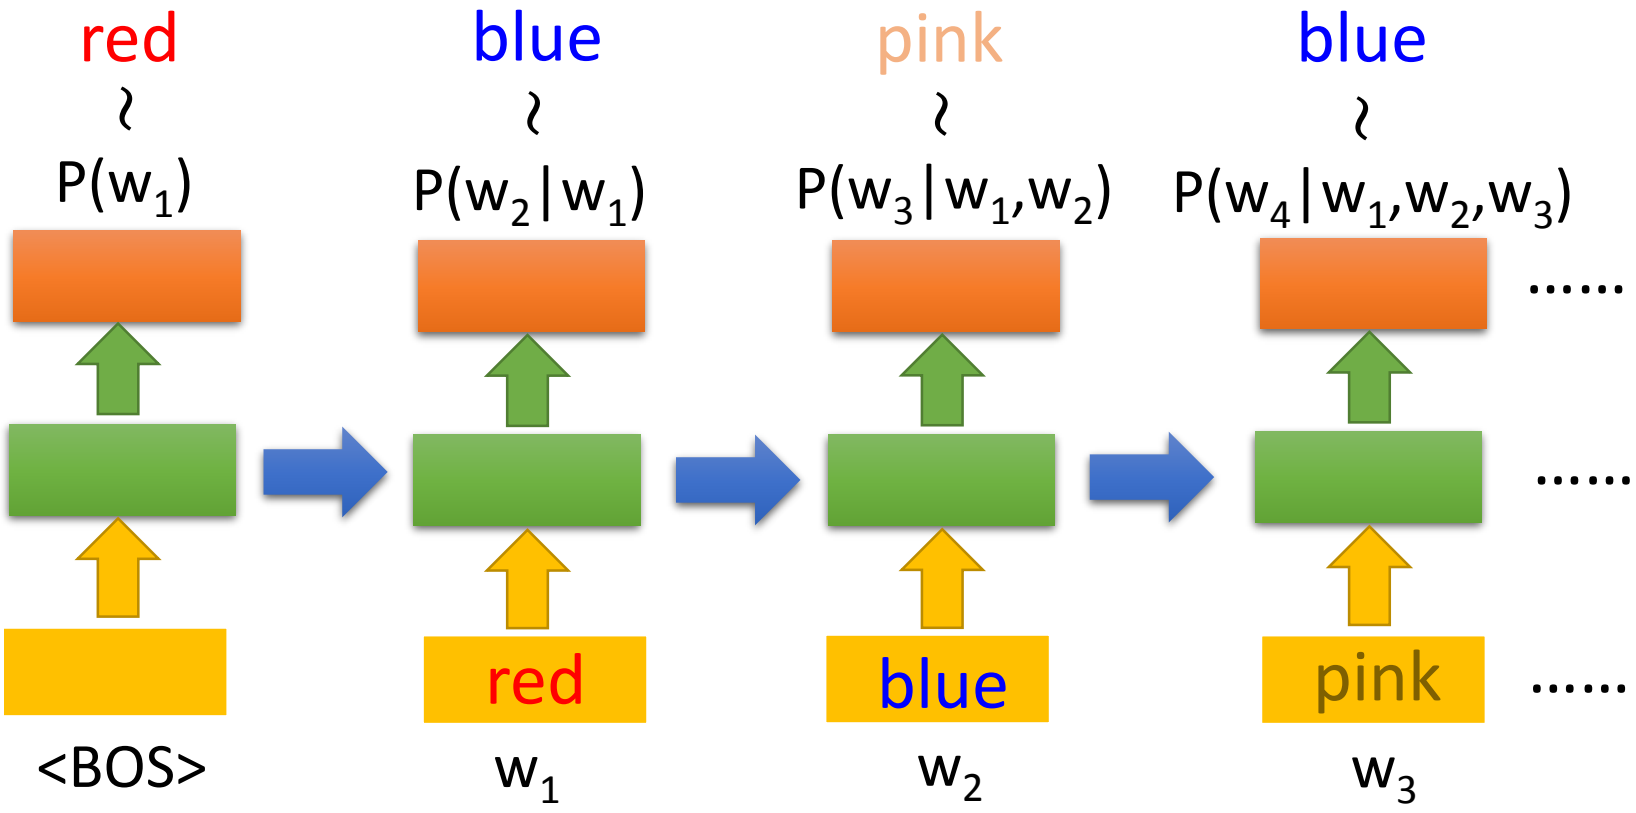


Consider as a sentence

blue red yellow gray ……

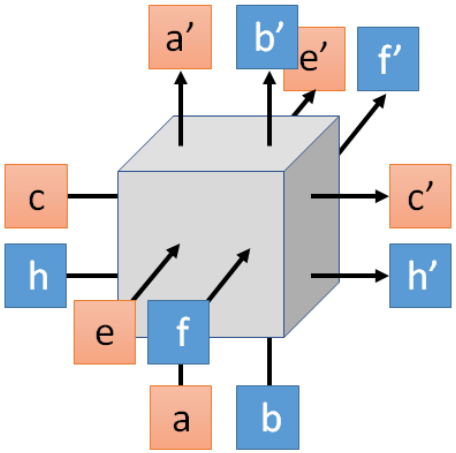
Train a language model based on the "sentences"

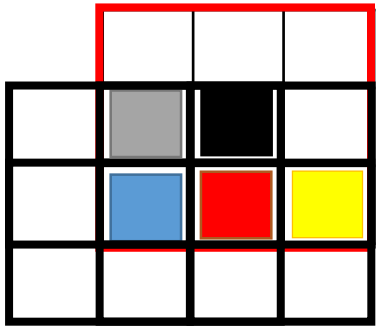
- Images are composed of pixels
  - Generating a pixel at each time by RNN

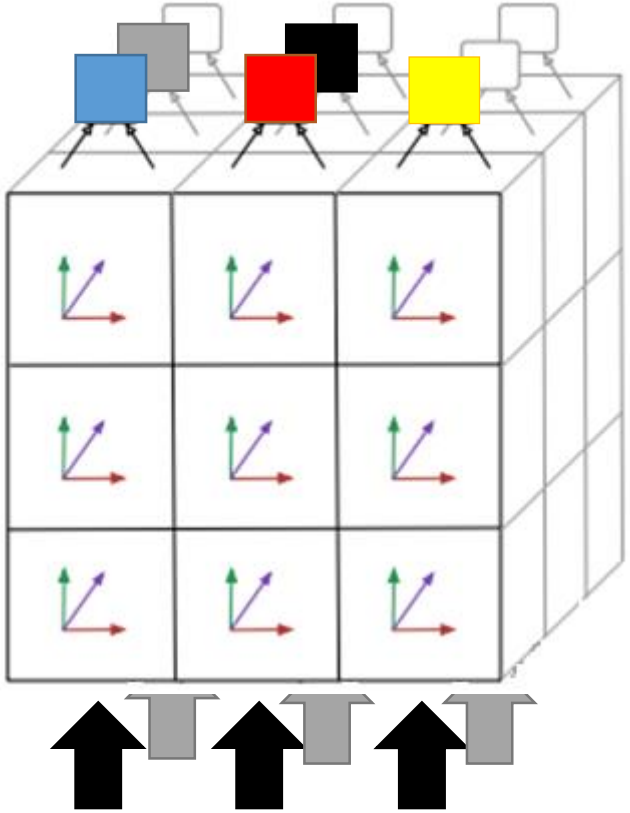


Generation

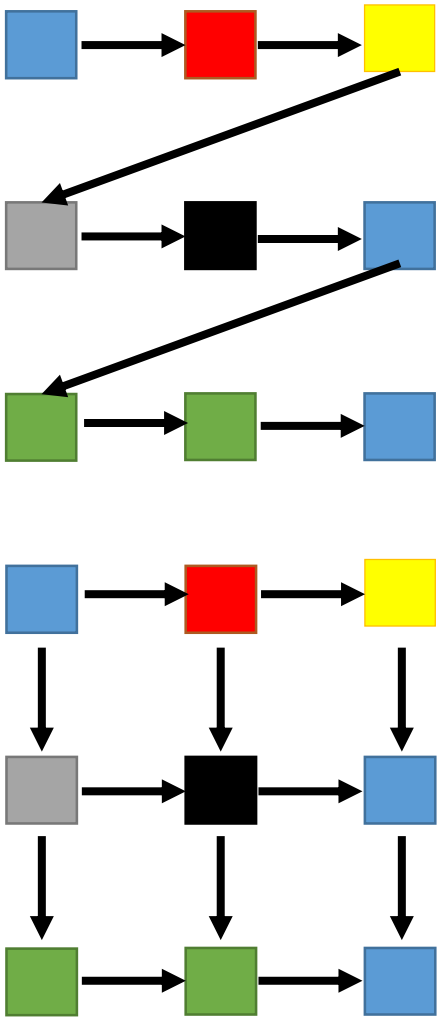
- Images are composed of pixels







3 x 3 images



Generation

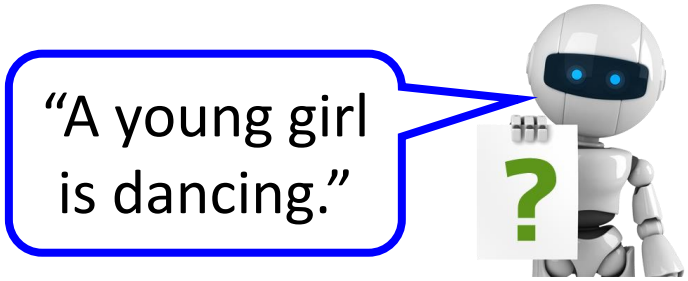
Conditional Generation

- We don't want to simply generate some random sentences.
- Generate sentences based on conditions:

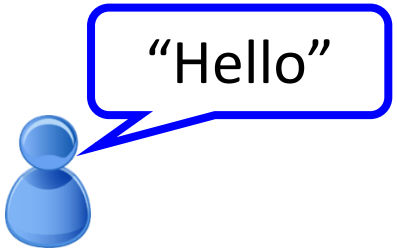
Caption Generation

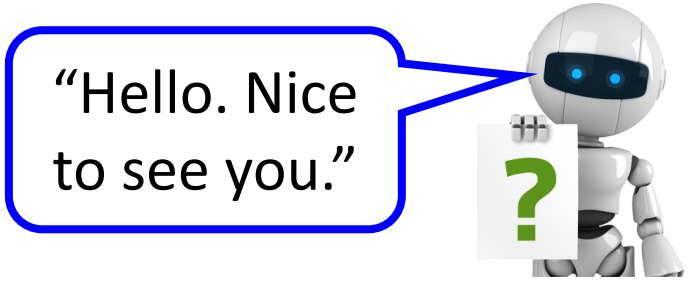
Given condition:



Chat-bot

Given condition:

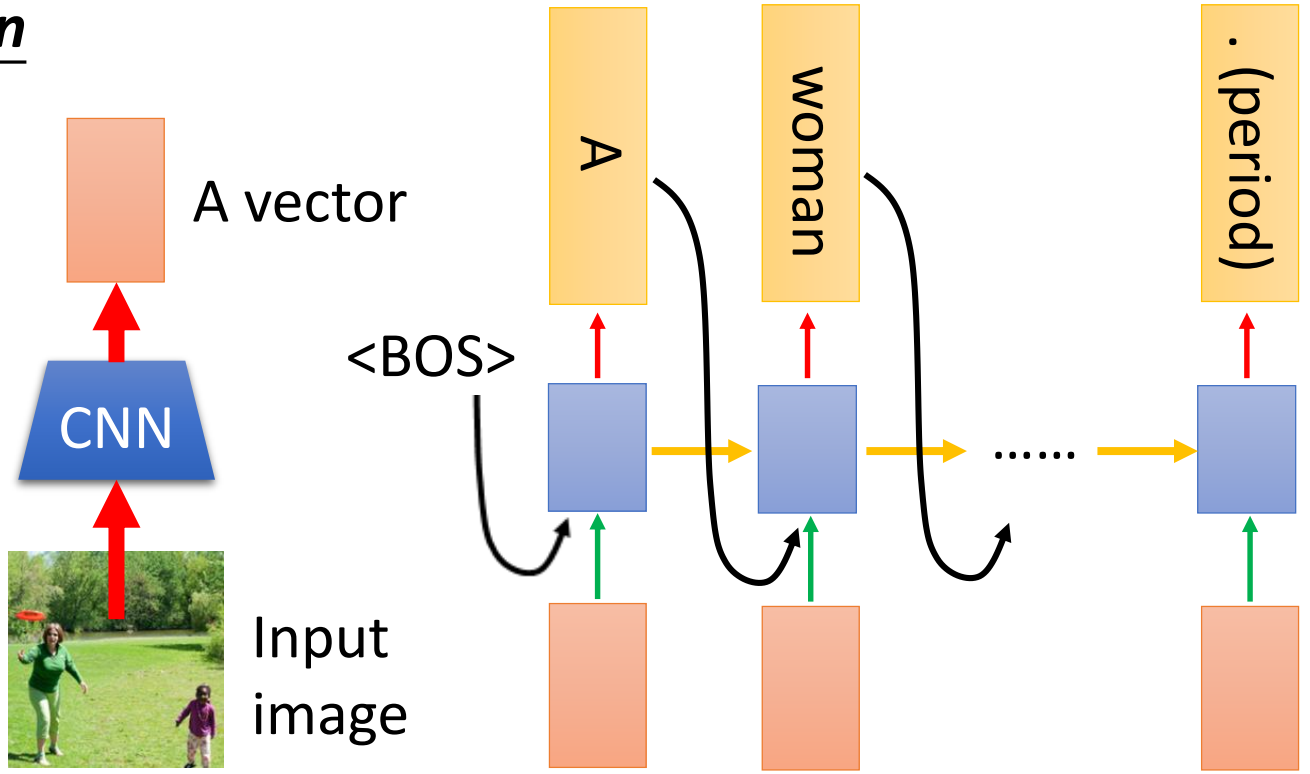




Conditional Generation

- Represent the input condition as a vector, and consider the vector as the input of RNN generator

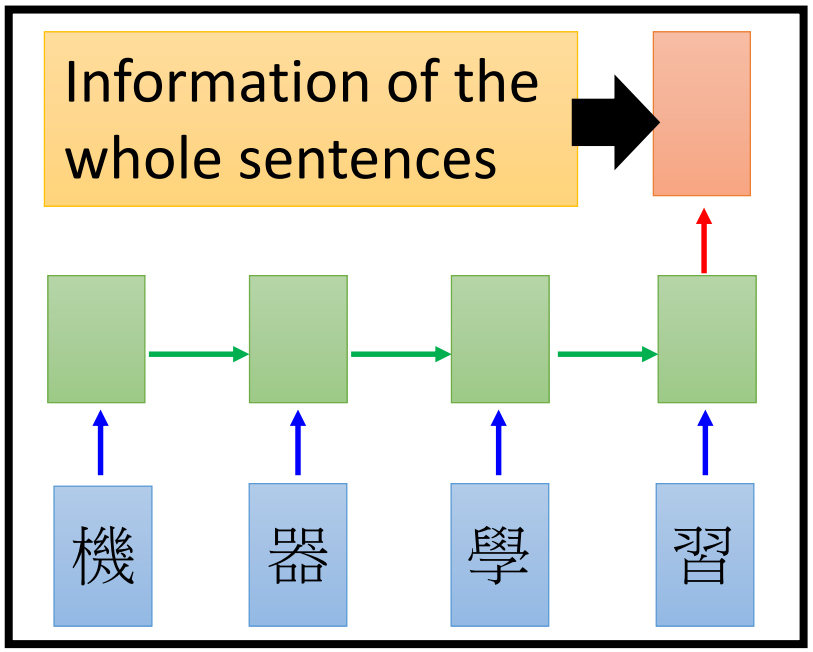
Image Caption Generation

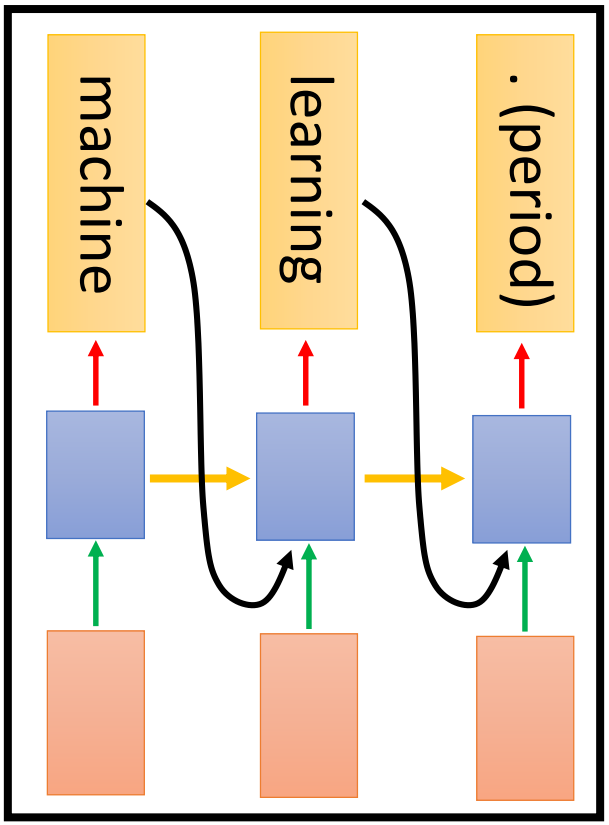


Conditional Generation

Sequence-to-sequence learning

- Represent the input condition as a vector, and consider the vector as the input of RNN generator
- E.g. Machine translation / Chat-bot





Encoder ← Jointly train → ***Decoder***

Conditional Generation

M: Hello

U: Hi

M: Hi

Need to consider longer context during chatting

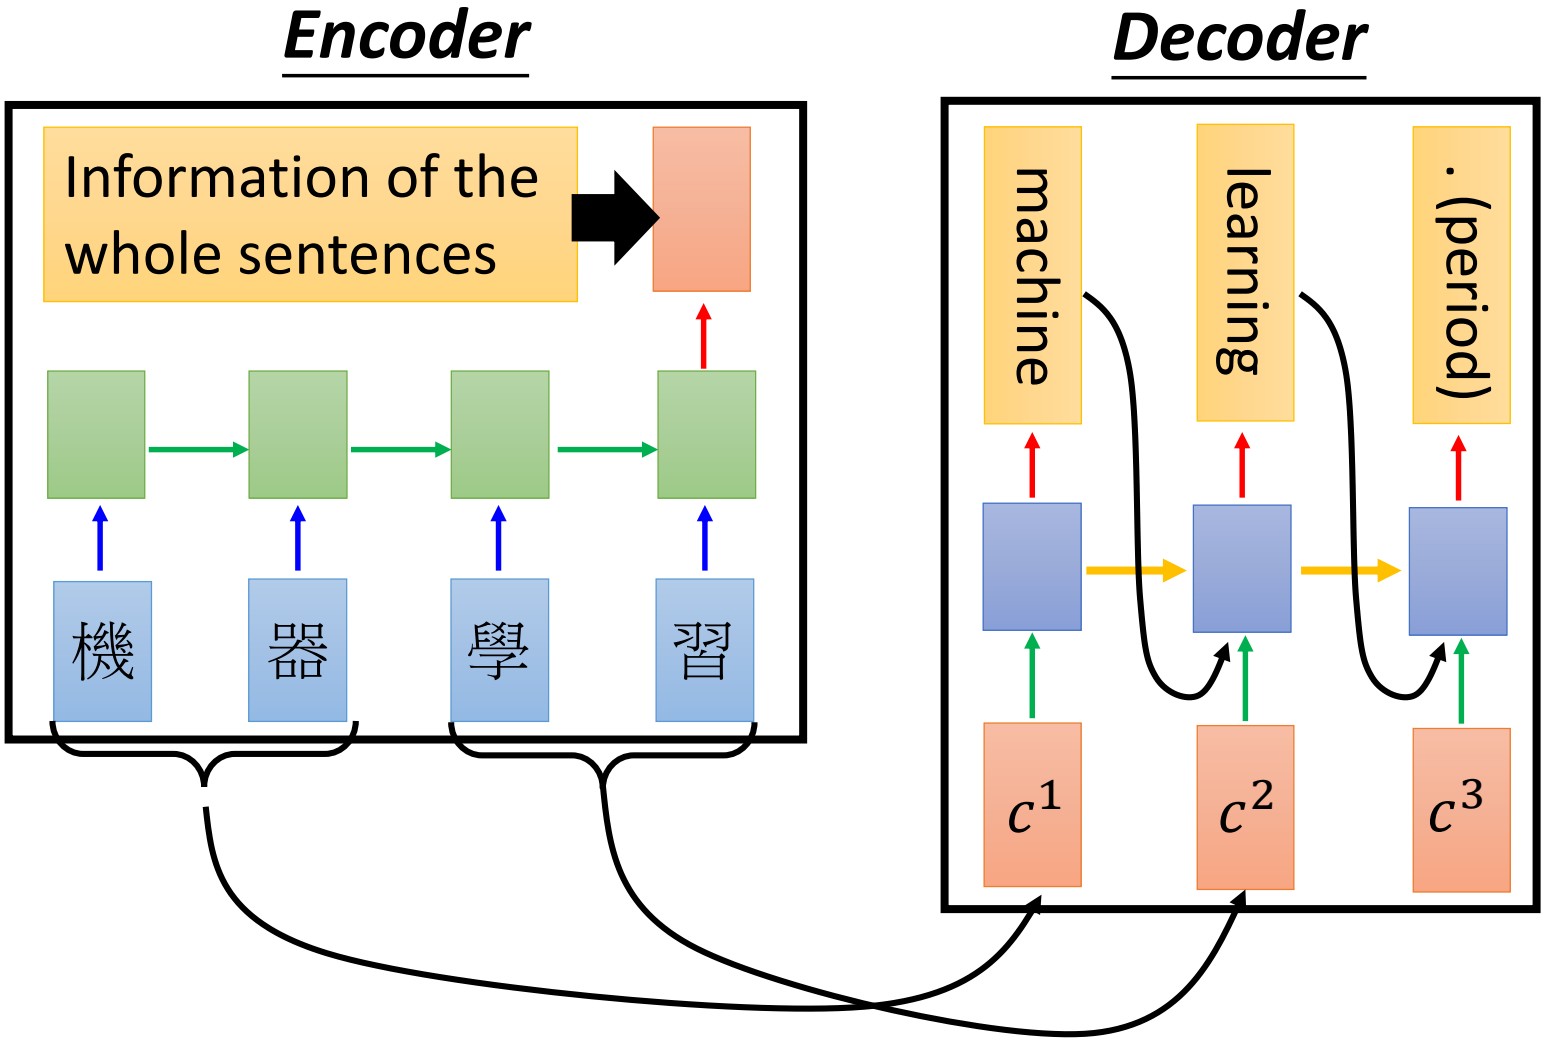
Attention

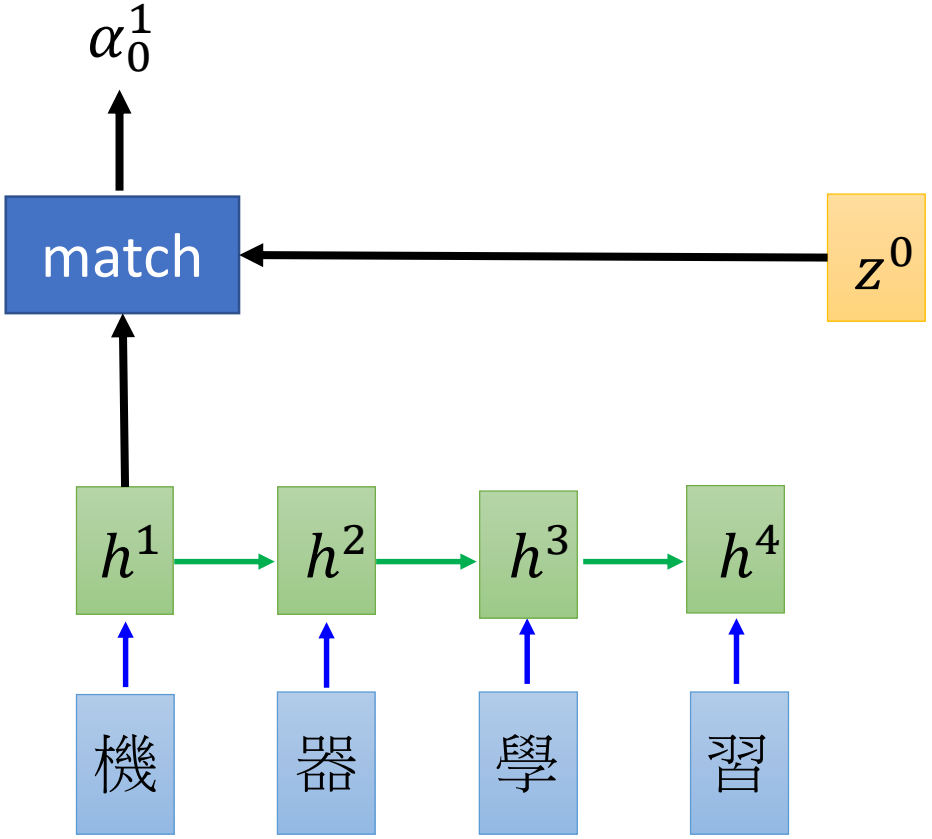
Dynamic Conditional Generation

Dynamic Conditional Generation

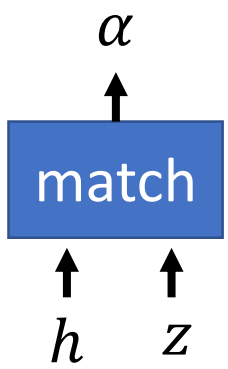


Machine Translation

- Attention-based model



Jointly learned with other part of the network



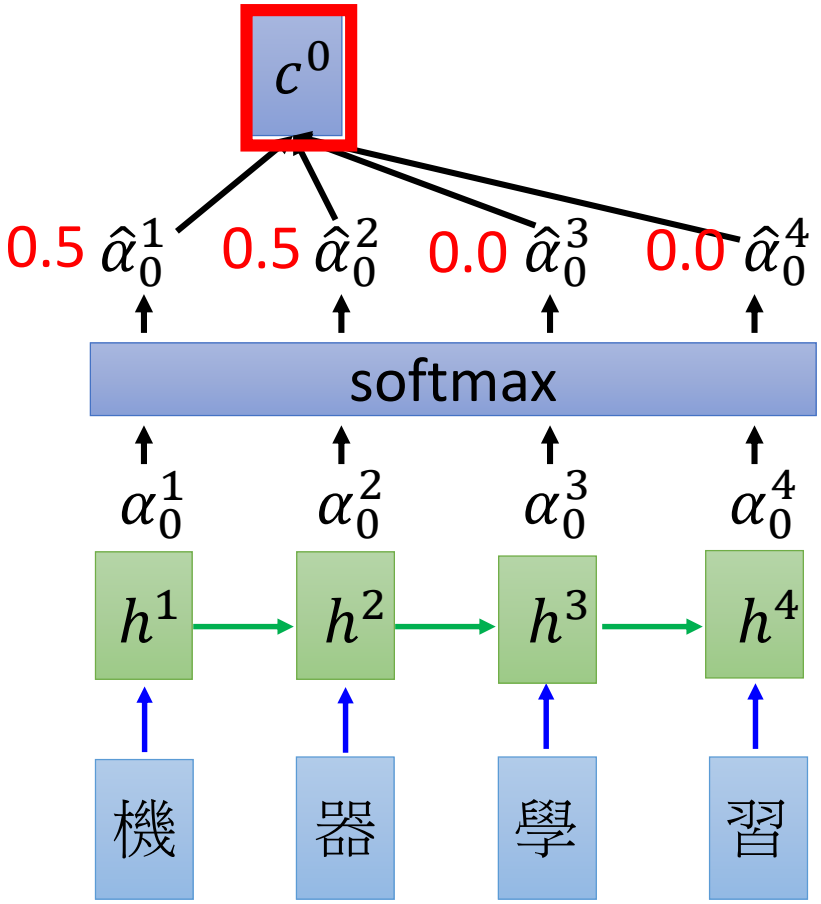
What is match ?

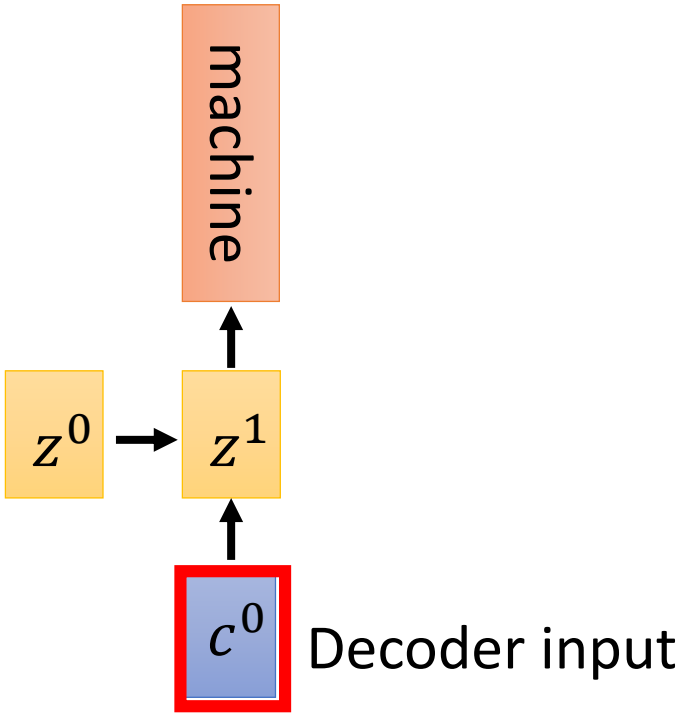
Design by yourself

- Cosine similarity of z and h
- Small NN whose input is z and h, output a scalar
- $\alpha = h^T W z$

Machine Translation

- Attention-based model



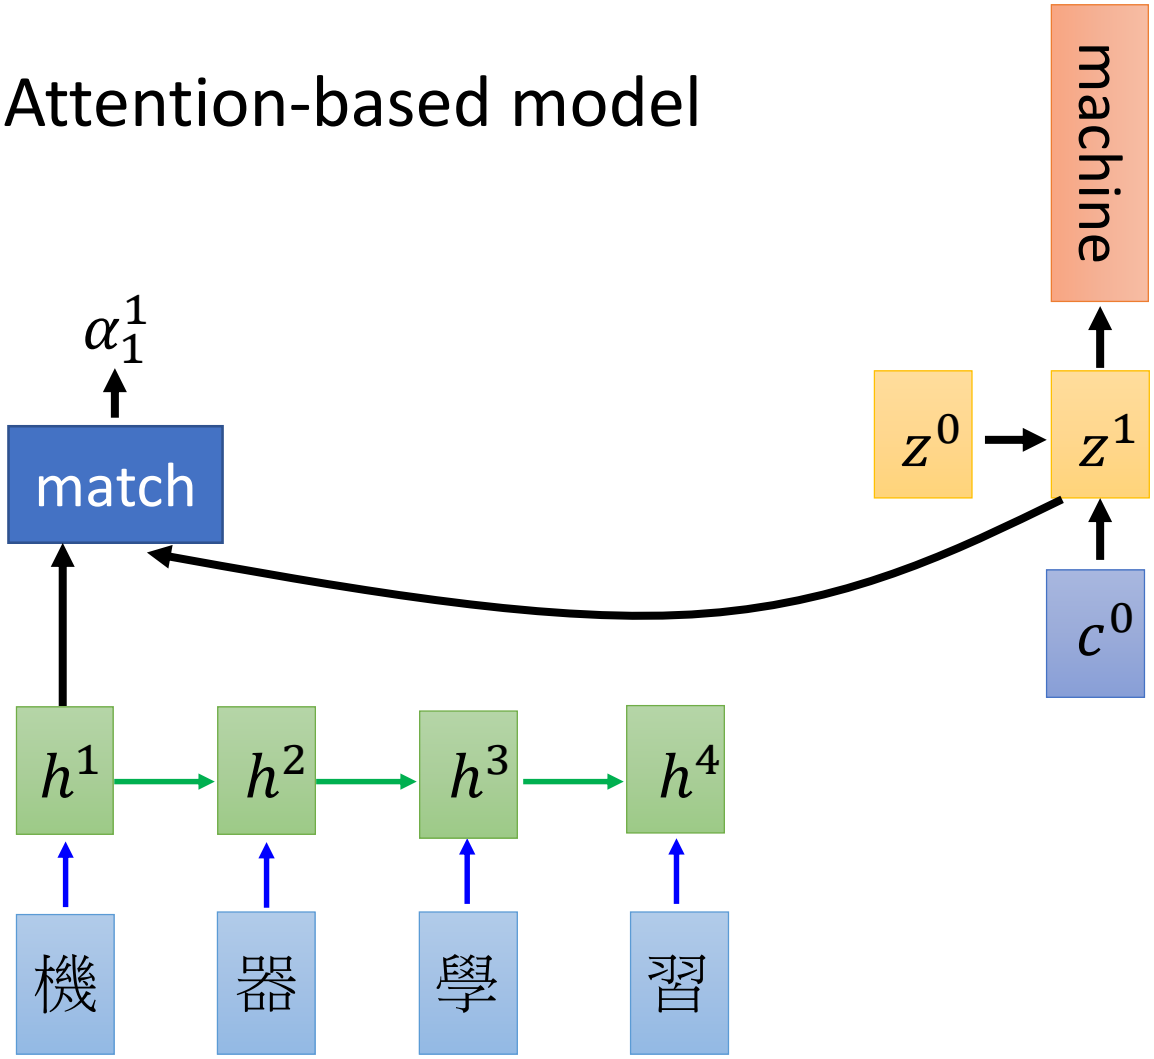


$$c^0 = \sum \hat{\alpha}_0^i h^i$$

$$= 0.5h^1 + 0.5h^2$$

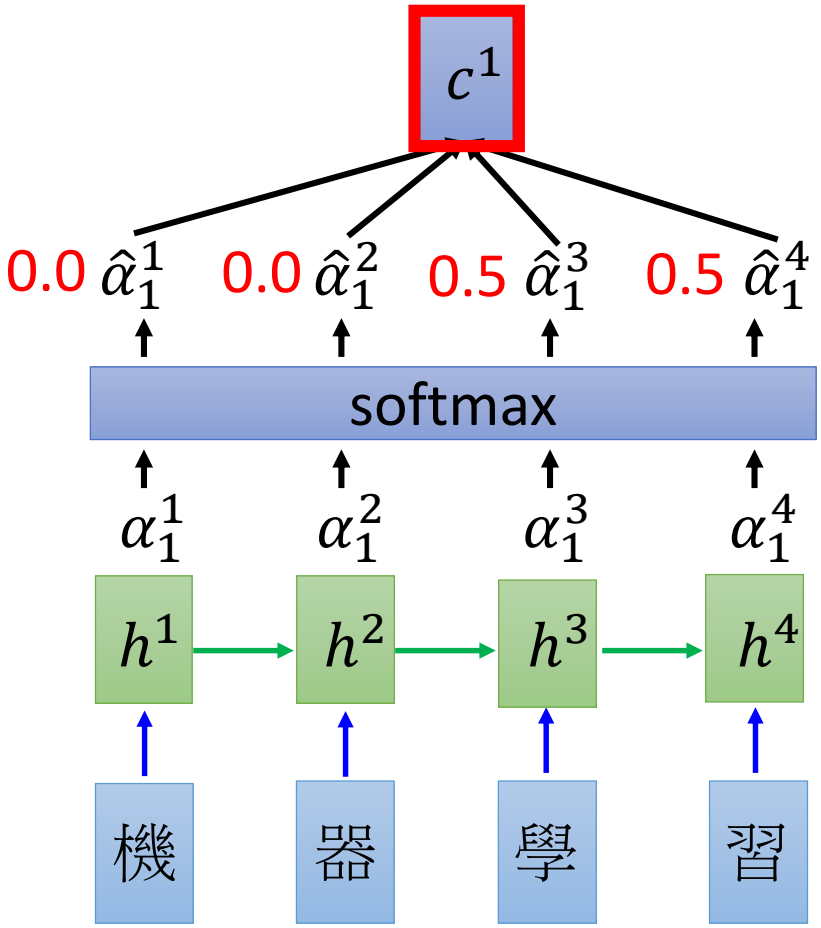
Machine Translation

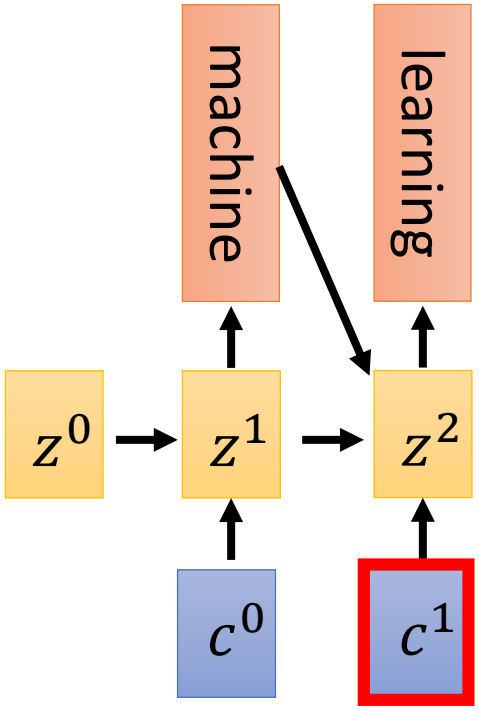
- Attention-based model



Machine Translation

- Attention-based model



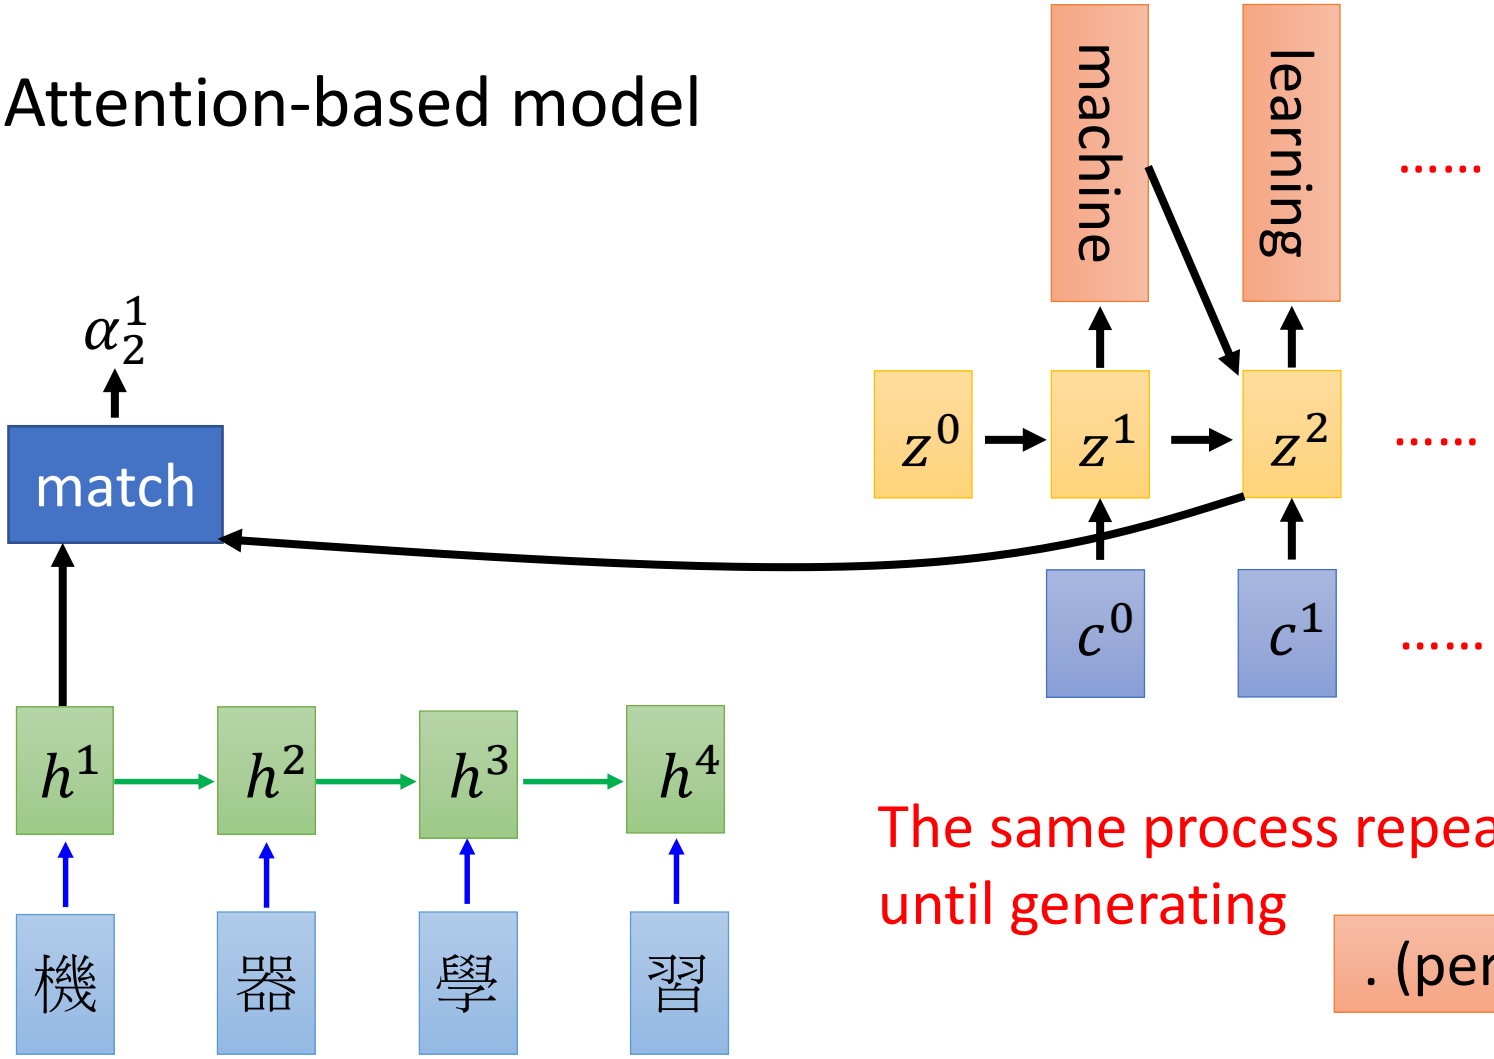


$$c^1 = \sum \hat{\alpha}_1^i h^i$$

$$= 0.5h^3 + 0.5h^4$$

Machine Translation

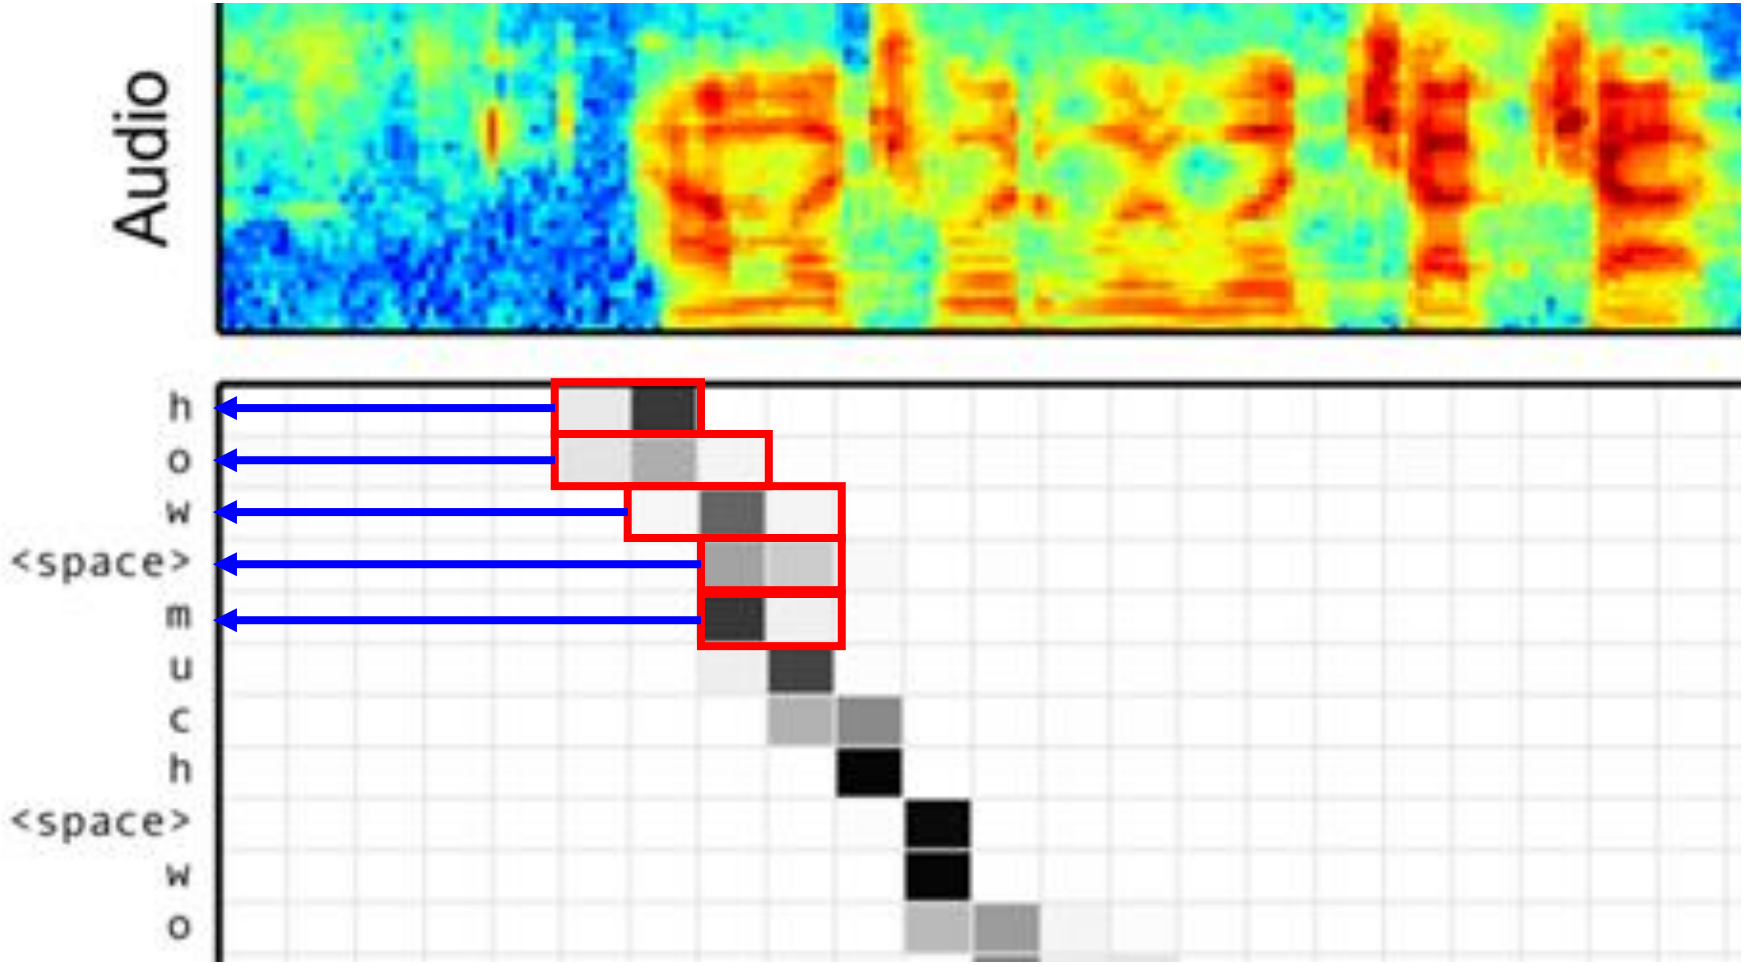
- Attention-based model



The same process repeat until generating

. (period)

Speech Recognition



Model	Clean WER	Noisy WER
CLDNN-HMM [22]	8.0	8.9
LAS	14.1	16.5
LAS + LM Rescoring	10.3	12.0

Image Caption Generation

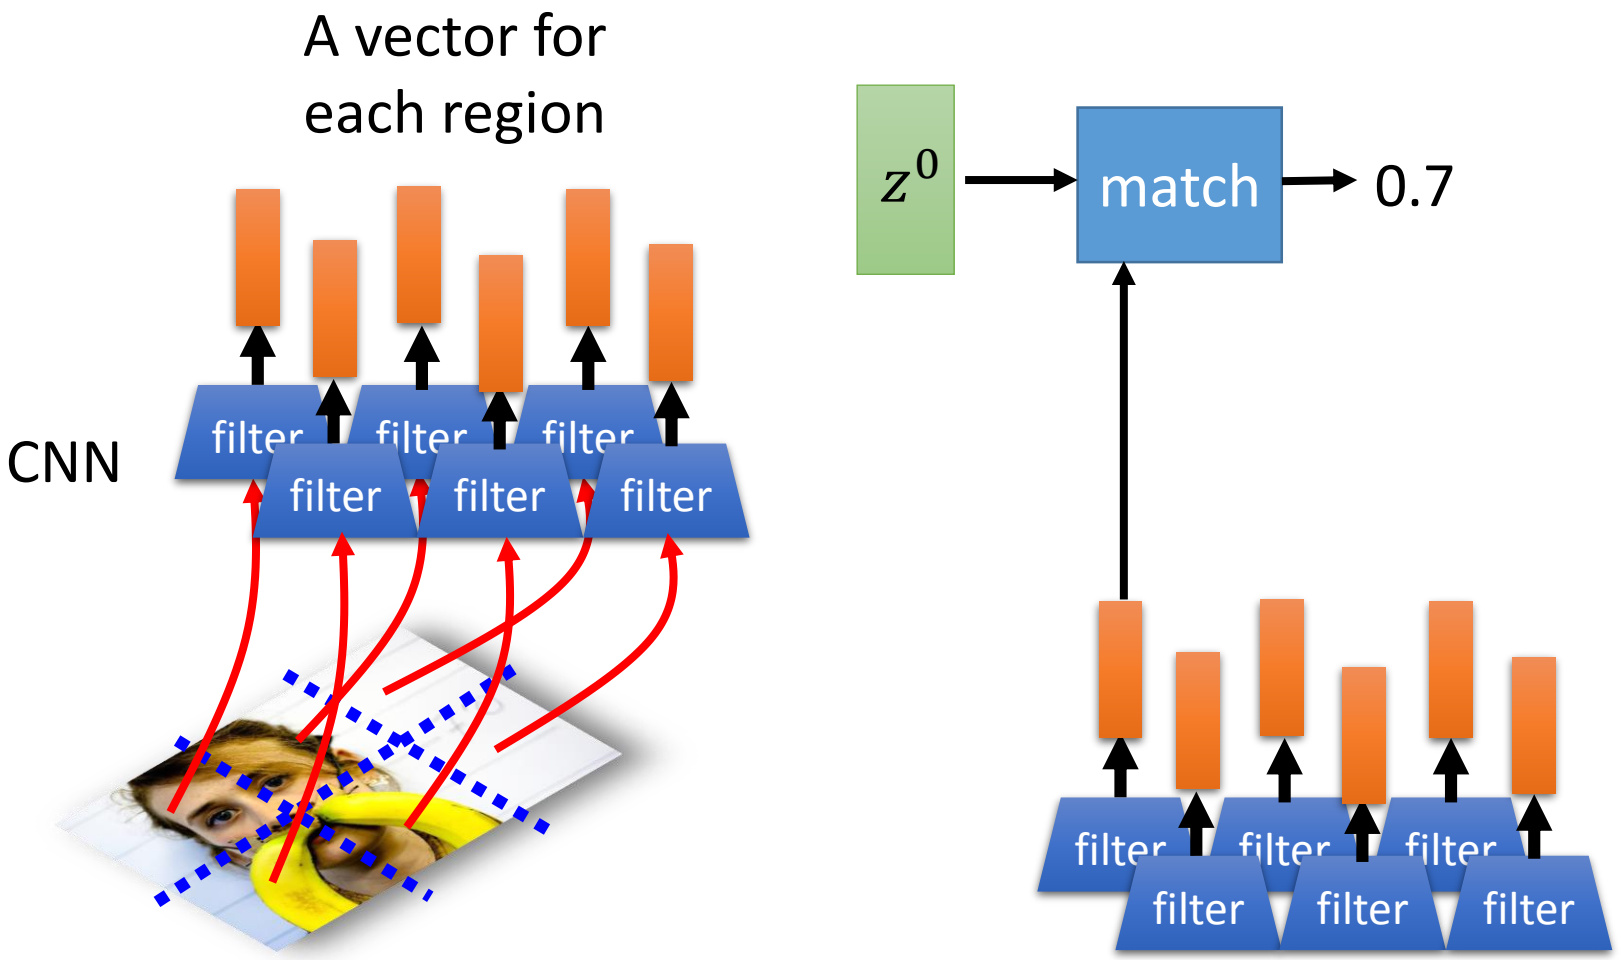

Image Caption Generation

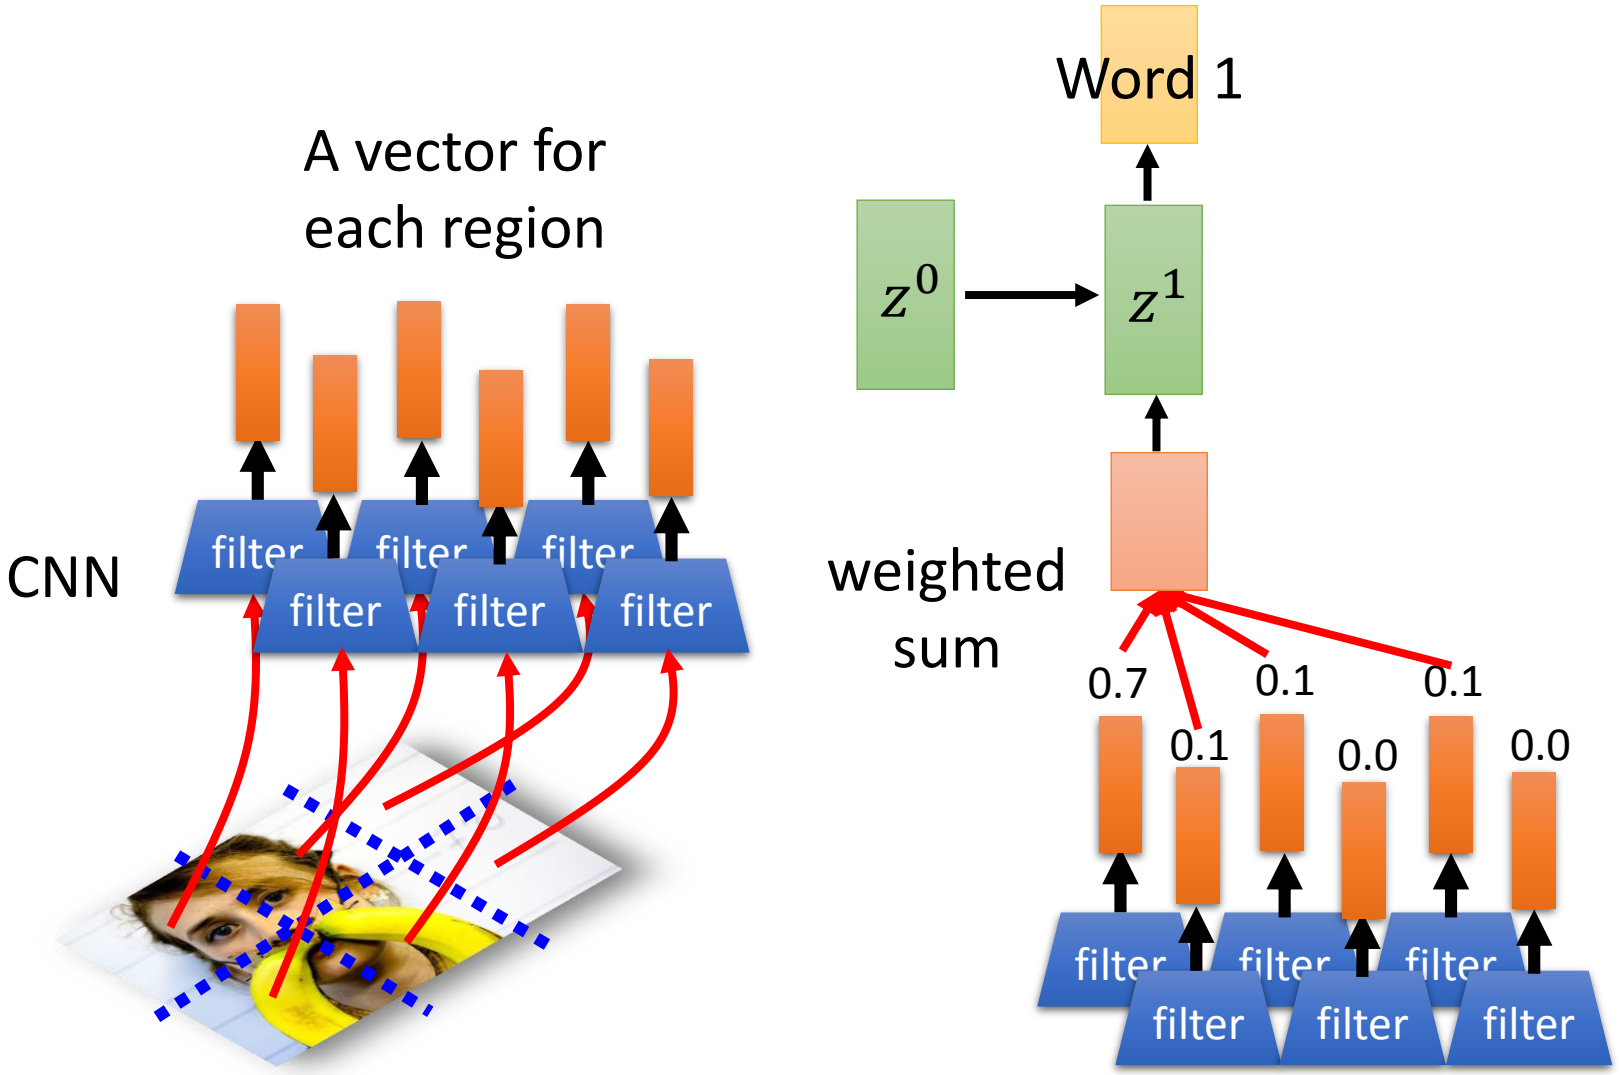

Image Caption Generation

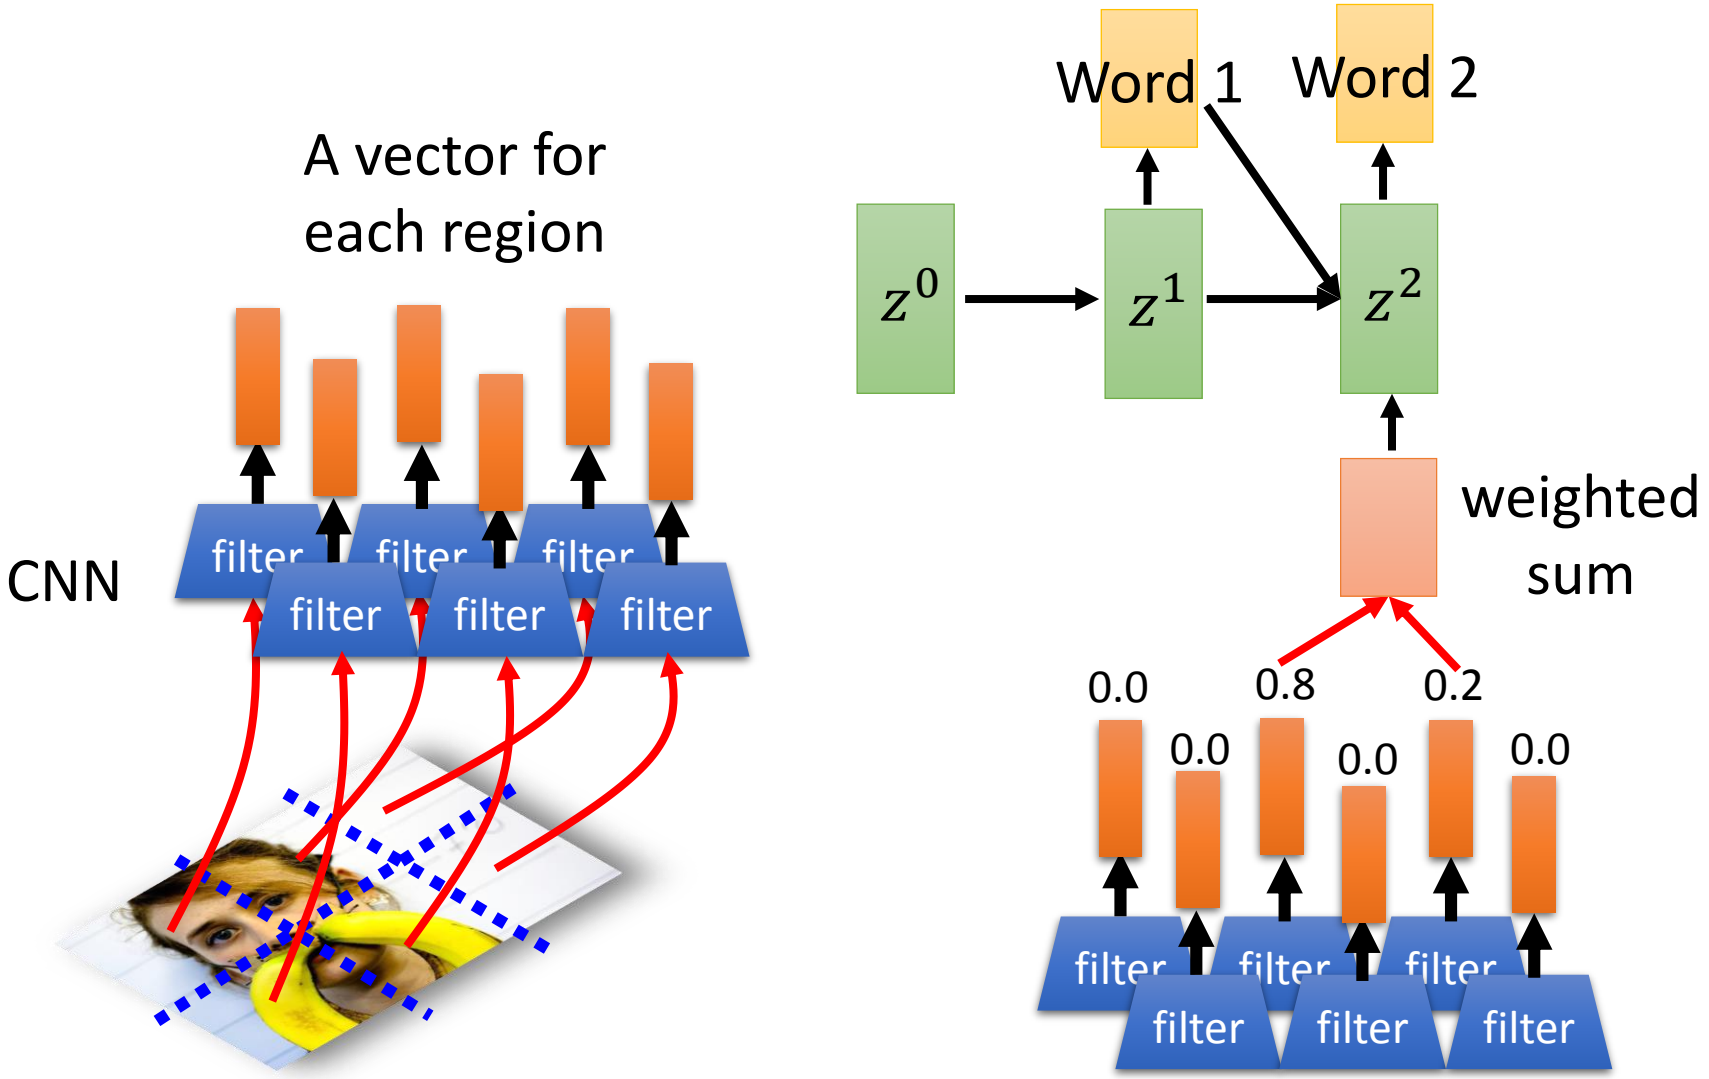

Image Caption Generation

A woman is throwing a frisbee in a park.

A dog is standing on a hardwood floor.

A stop sign is on a road with a mountain in the background.

A little girl sitting on a bed with a teddy bear.

A group of people sitting on a boat in the water.

A giraffe standing in a forest with trees in the background.

Kelvin Xu, Jimmy Ba, Ryan Kiros, Kyunghyun Cho, Aaron Courville, Ruslan Salakhutdinov, Richard Zemel, Yoshua Bengio, “Show, Attend and Tell: Neural Image Caption Generation with Visual Attention”, ICML, 2015

Image Caption Generation

A large white bird standing in a forest.

A woman holding a clock in her hand.

A man wearing a hat and a hat on a skateboard.

A person is standing on a beach with a surfboard.

A woman is sitting at a table with a large pizza.

A man is talking on his cell phone while another man watches.

Kelvin Xu, Jimmy Ba, Ryan Kiros, Kyunghyun Cho, Aaron Courville, Ruslan Salakhutdinov, Richard Zemel, Yoshua Bengio, “Show, Attend and Tell: Neural Image Caption Generation with Visual Attention”, ICML, 2015

Ref: A man and a woman ride a motorcycle

A **man** and a **woman** are **talking** on the **road**

Ref: A woman is frying food

Someone is **frying** a **fish** in a **pot**

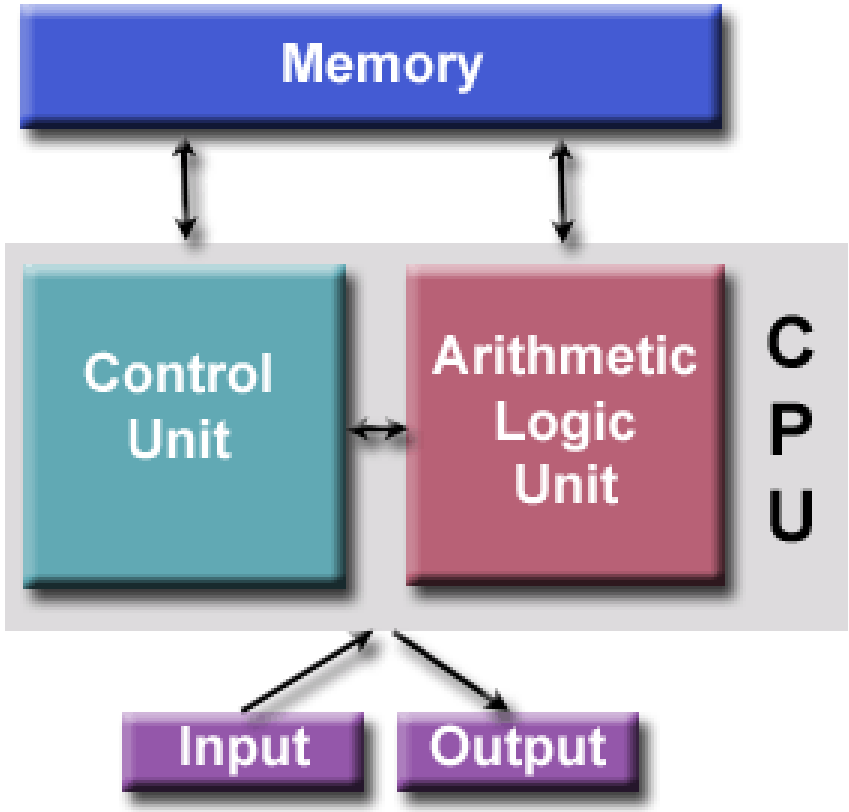
Neural Turing Machine

- von Neumann architecture

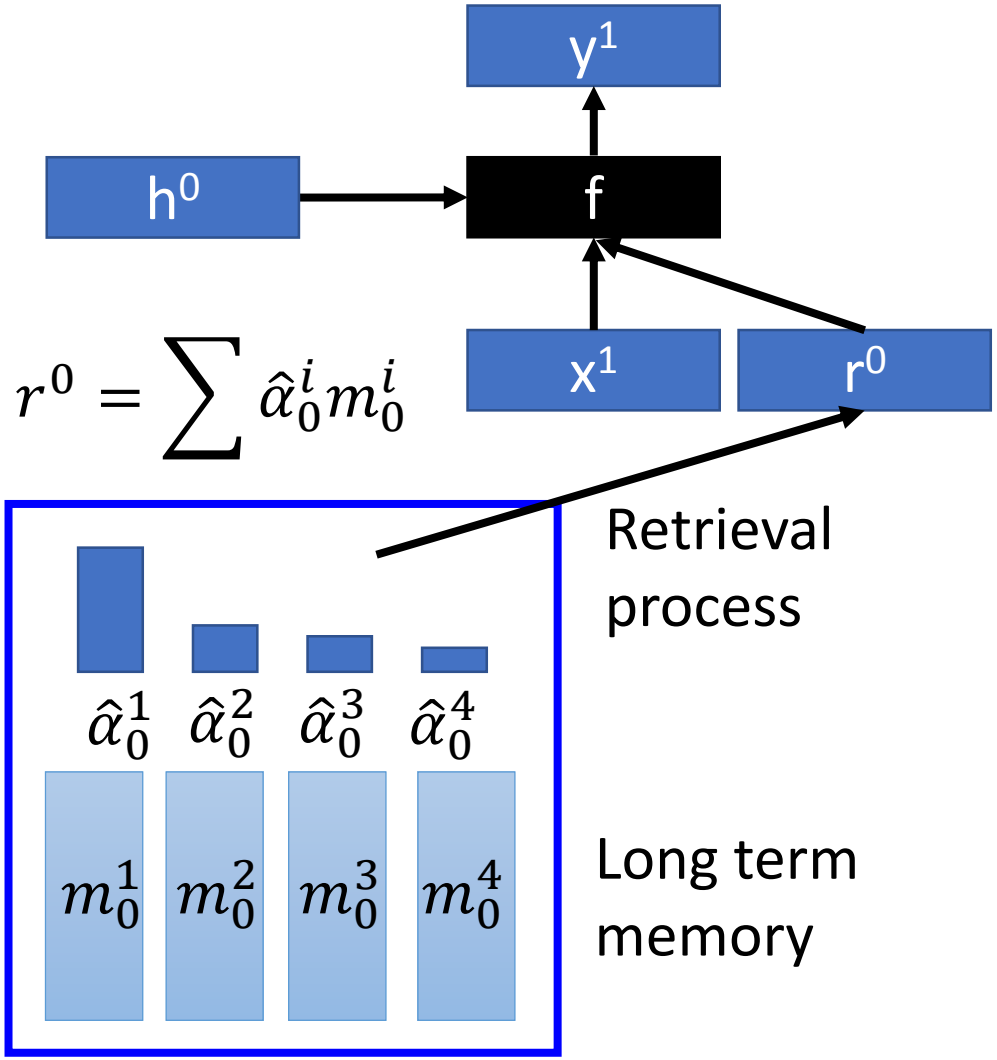


Neural Turing Machine not only read from memory

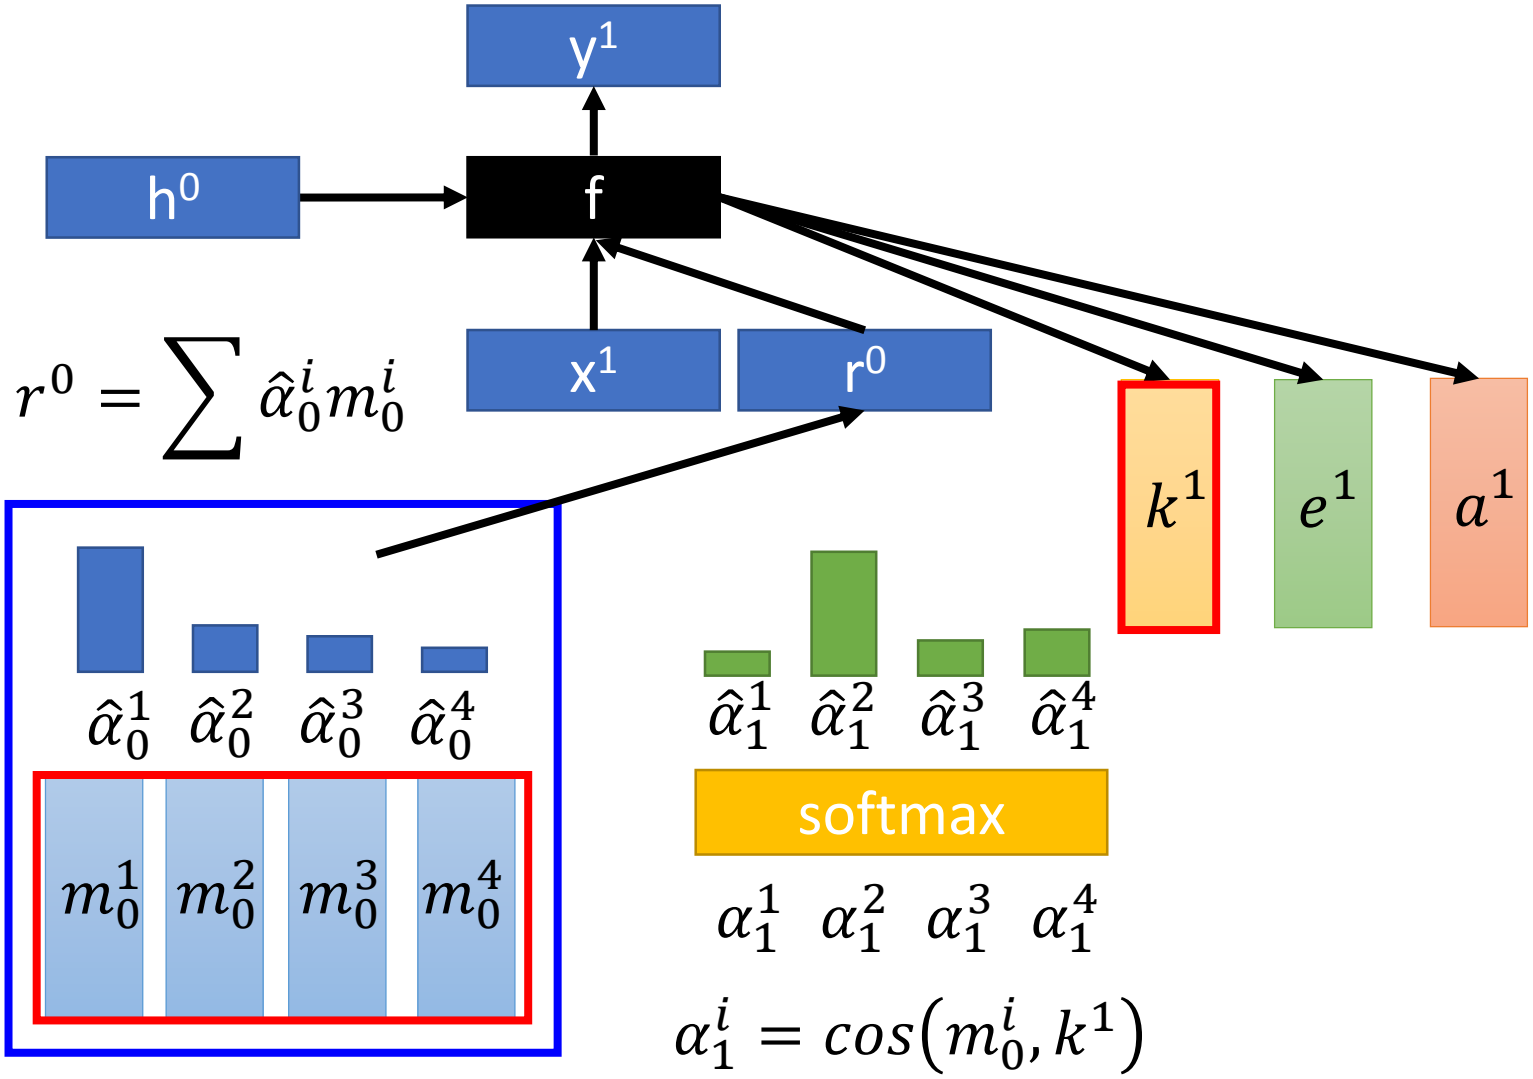
Also modify the memory through attention

https://www.quora.com/How-does-the-Von-Neumann-architecture-provide-flexibility-for-program-development

Neural Turing Machine

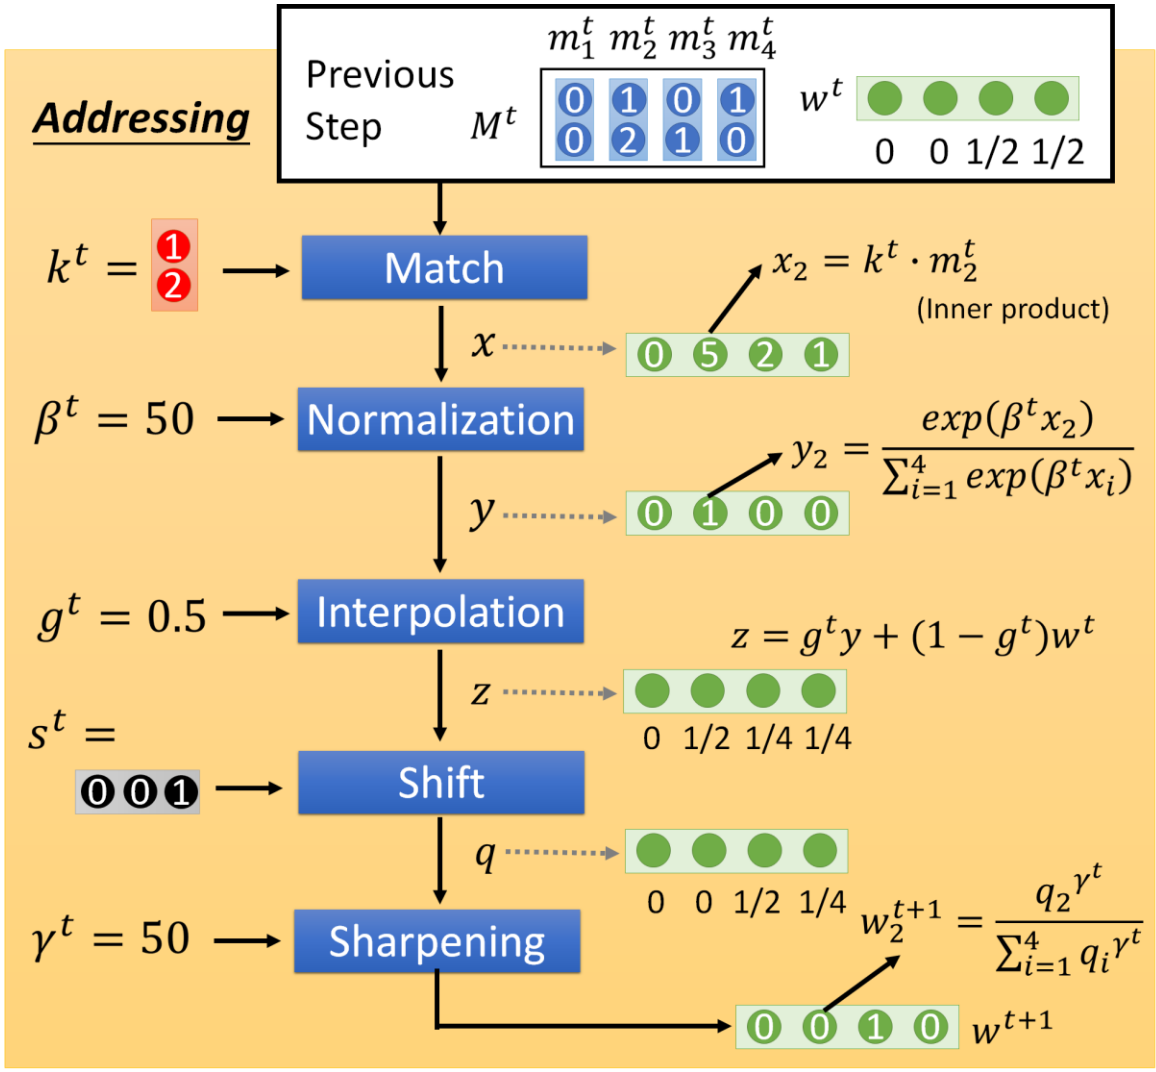


Neural Turing Machine



Neural Turing Machine

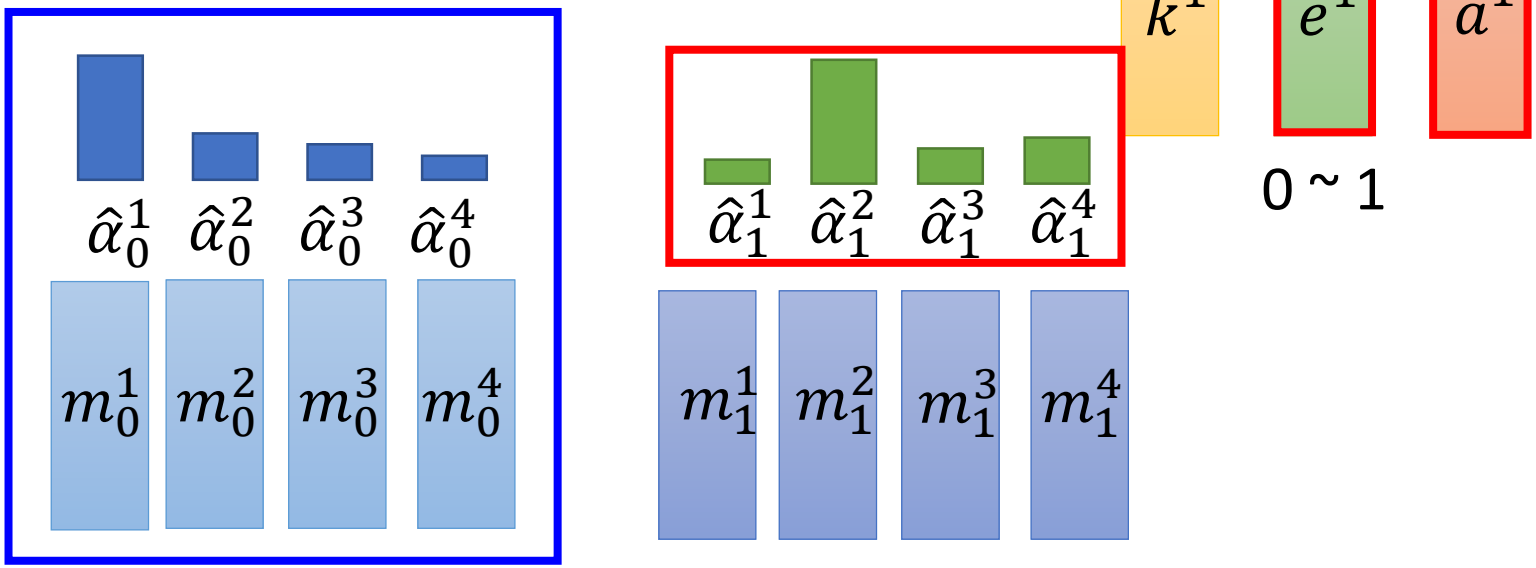
- Real version



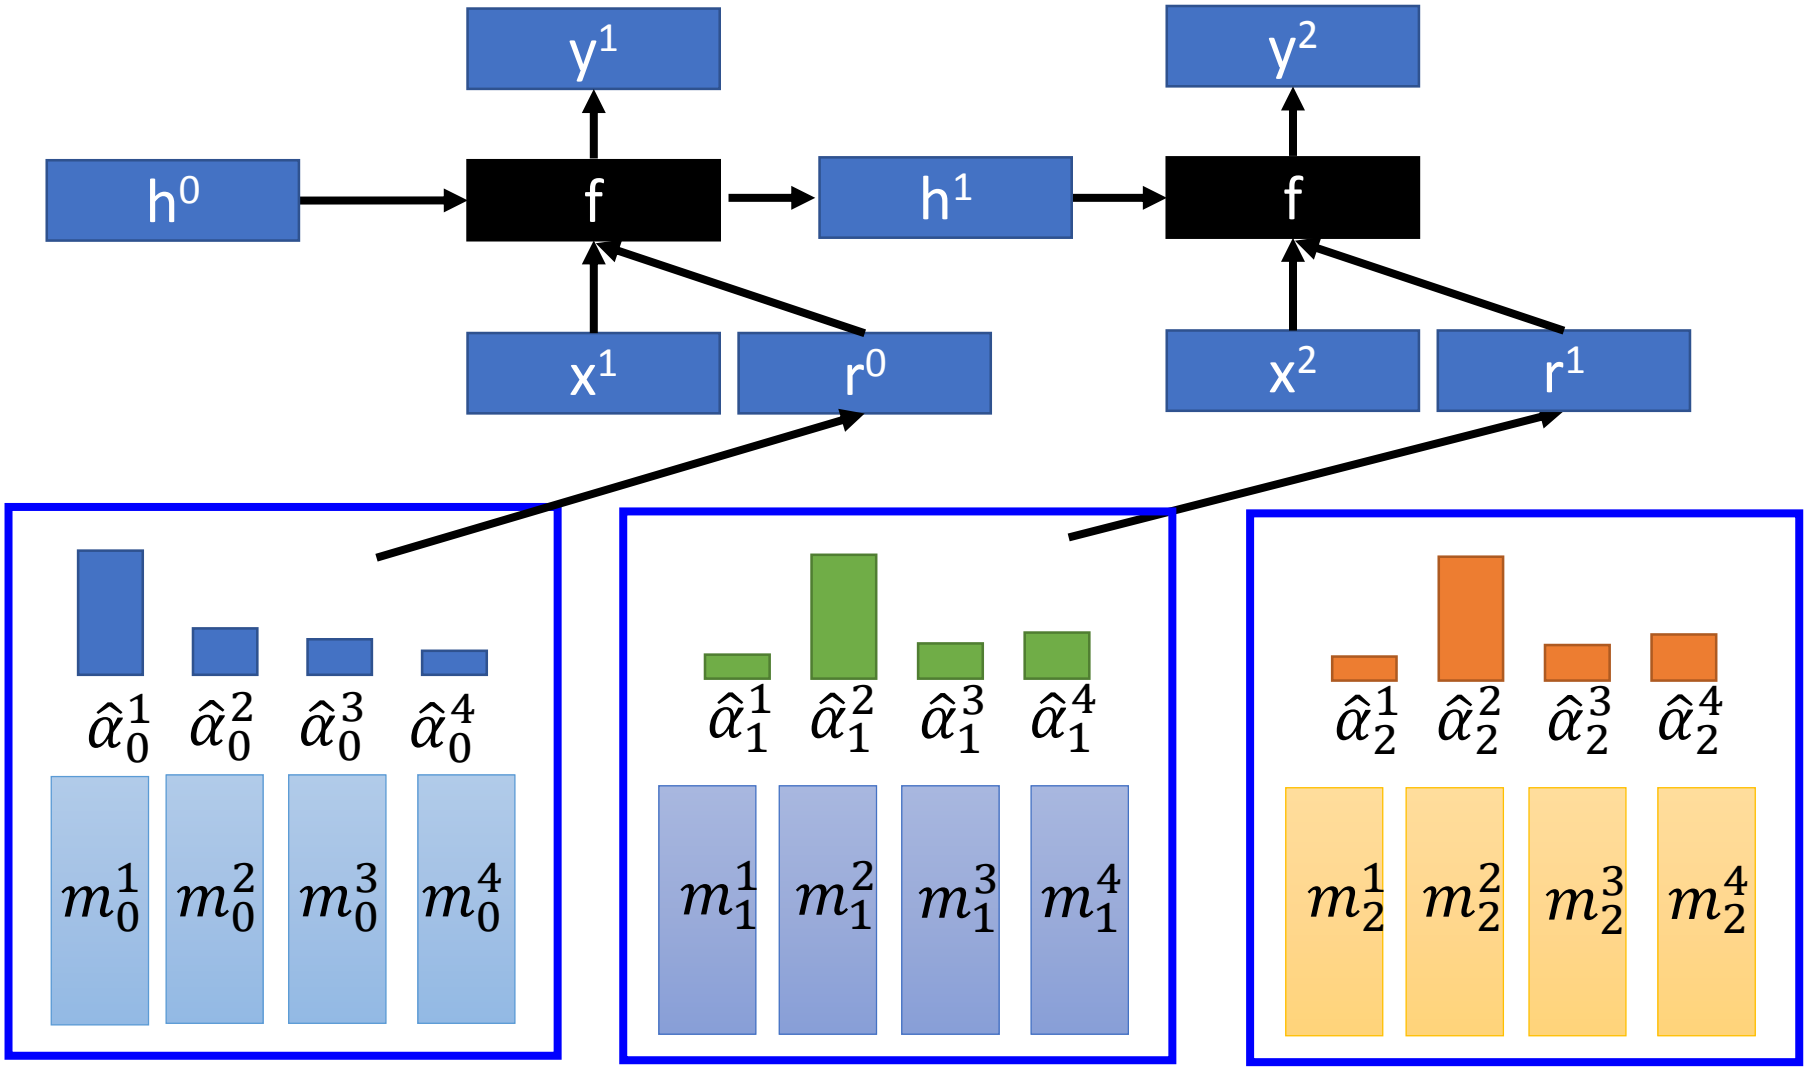
Neural Turing Machine

$$m_1^i = m_0^i - \hat{\alpha}_1^i \, e^1 \odot m_0^i + \hat{\alpha}_1^i \, a^1$$

(element-wise)



Neural Turing Machine



Tips for Generation

Attention

Kelvin Xu, Jimmy Ba, Ryan Kiros, Kyunghyun Cho, Aaron Courville, Ruslan Salakhutdinov, Richard Zemel, Yoshua Bengio, "Show, Attend and Tell: Neural Image Caption Generation with Visual Attention", ICML, 2015

component

α_t^i

time

Bad Attention

$\alpha_1^1 \alpha_2^1 \alpha_3^1 \alpha_4^1$ $\alpha_1^2 \alpha_2^2 \alpha_3^2 \alpha_4^2$ $\alpha_1^3 \alpha_2^3 \alpha_3^3 \alpha_4^3$ $\alpha_1^4 \alpha_2^4 \alpha_3^4 \alpha_4^4$

w_1 w_2 (woman) w_3 w_4 (woman) …… no cooking

Good Attention: each input component has approximately the same attention weight

E.g. Regularization term: $\sum_i \left(\tau - \sum_t \alpha_t^i\right)^2$

For each component

Over the generation

Mismatch between Train and Test

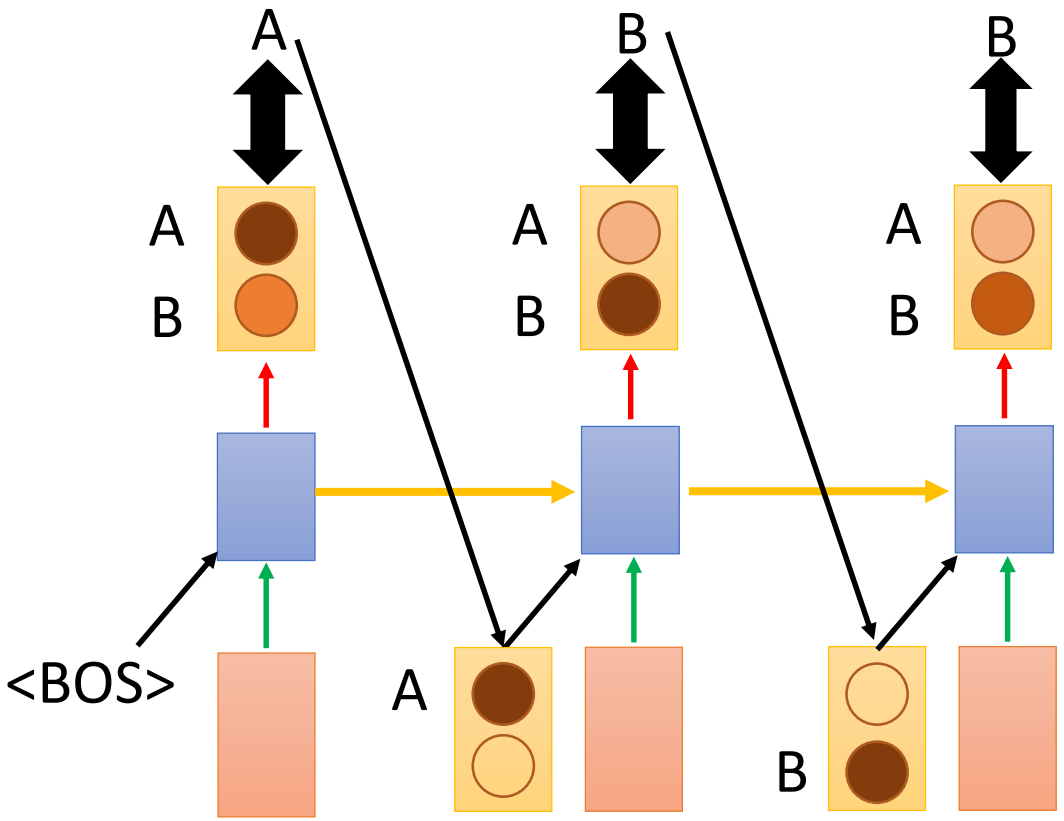
- ***Training***

$$C = \sum_t C_t$$

Minimizing cross-entropy of each component

: condition

Reference:



Mismatch between Train and Test

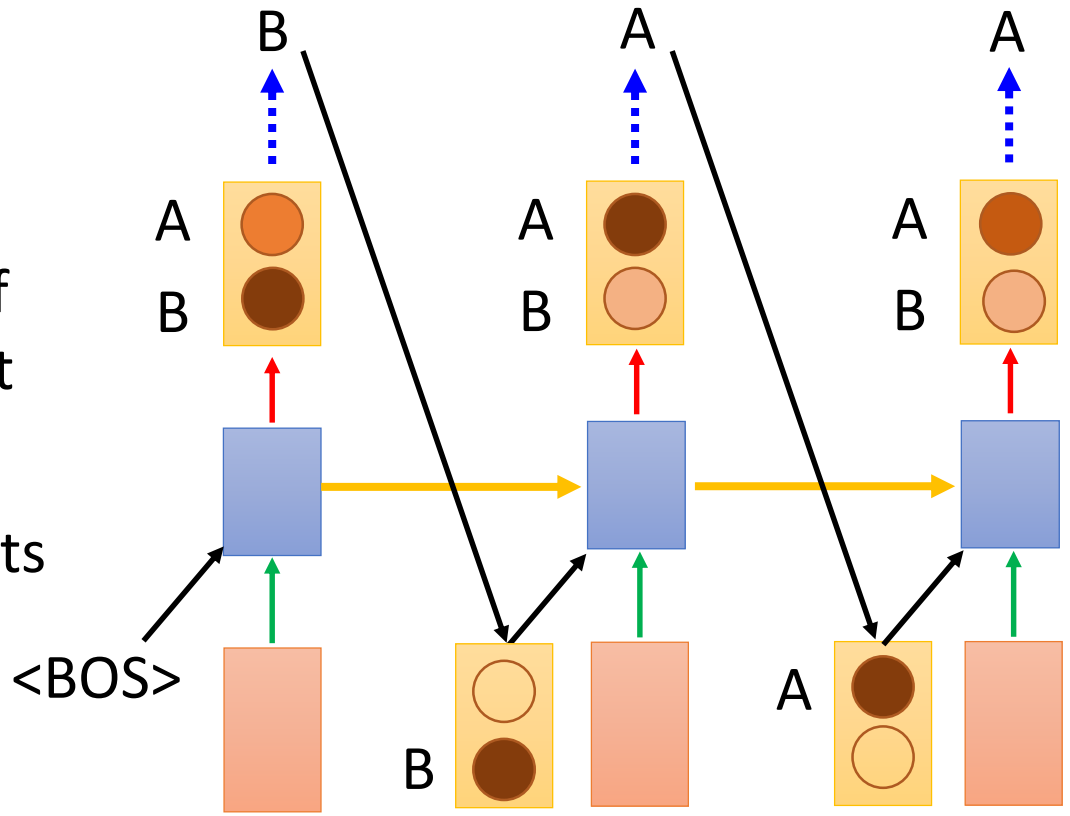
- ***Generation***

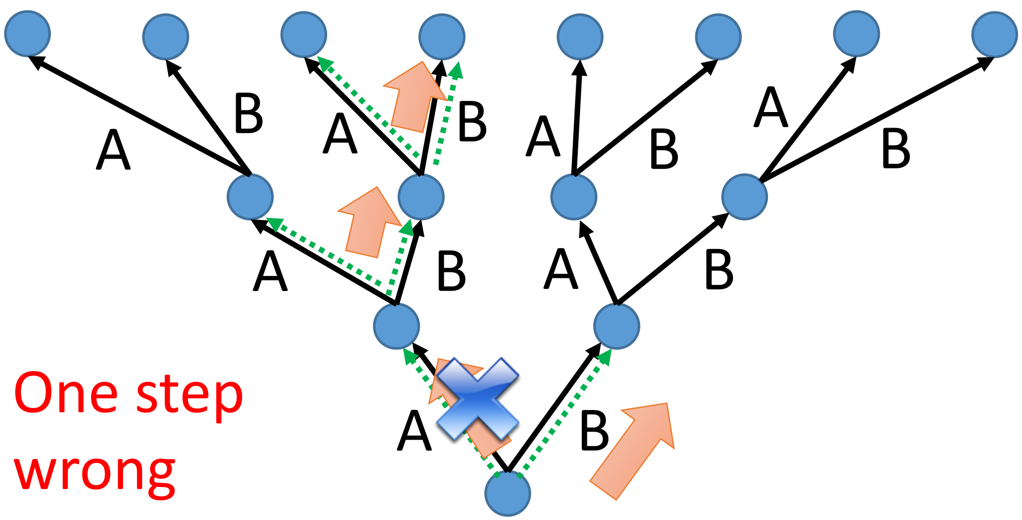
We do not know the reference

Testing: Output of model is the input of the next step.

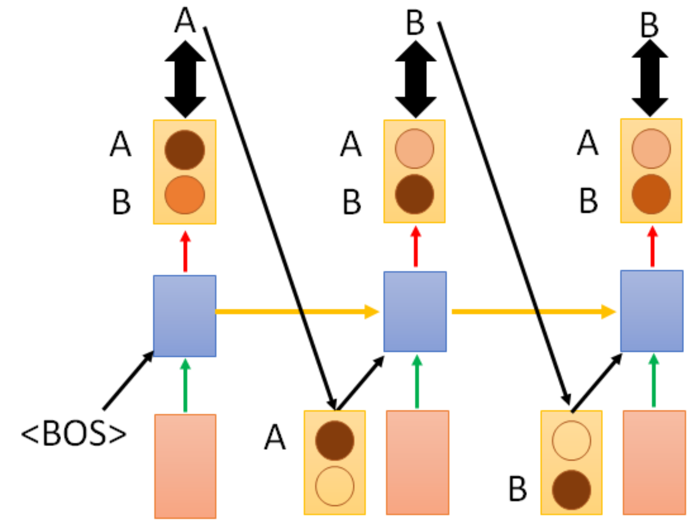
Training: the inputs are reference.

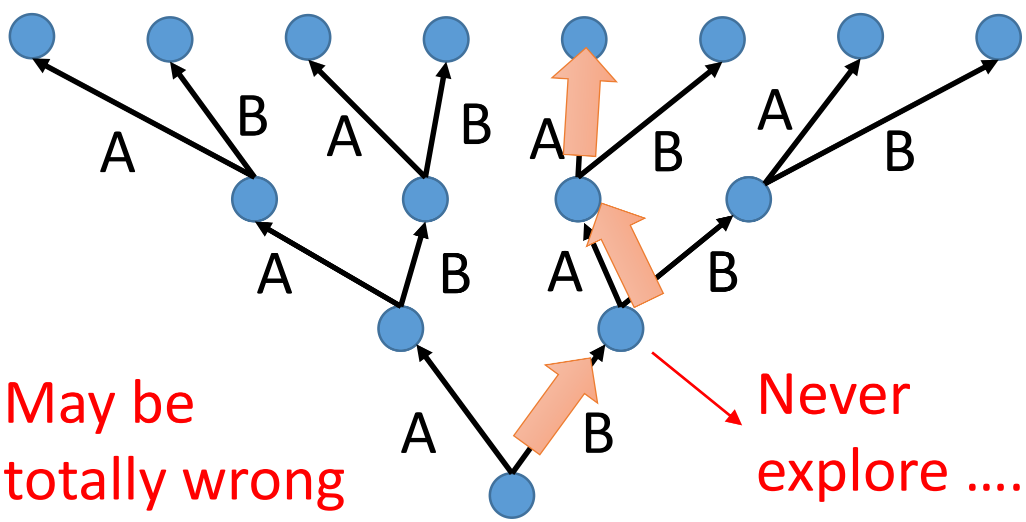
Exposure Bias





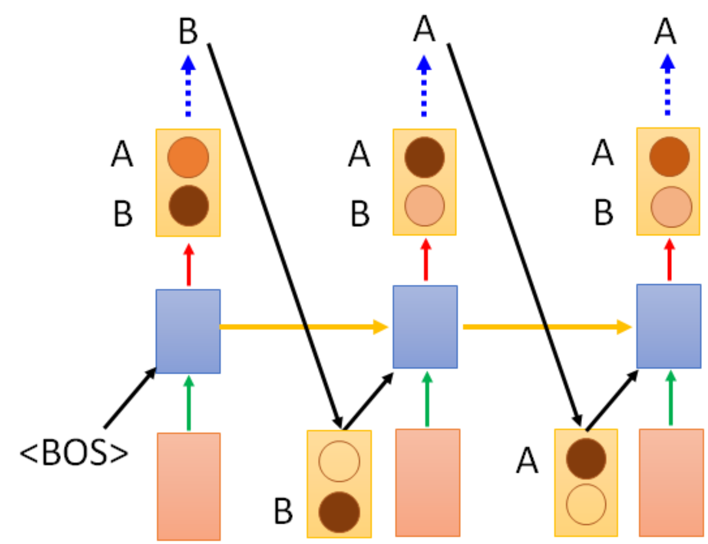
One step wrong





May be totally wrong

Never explore ......



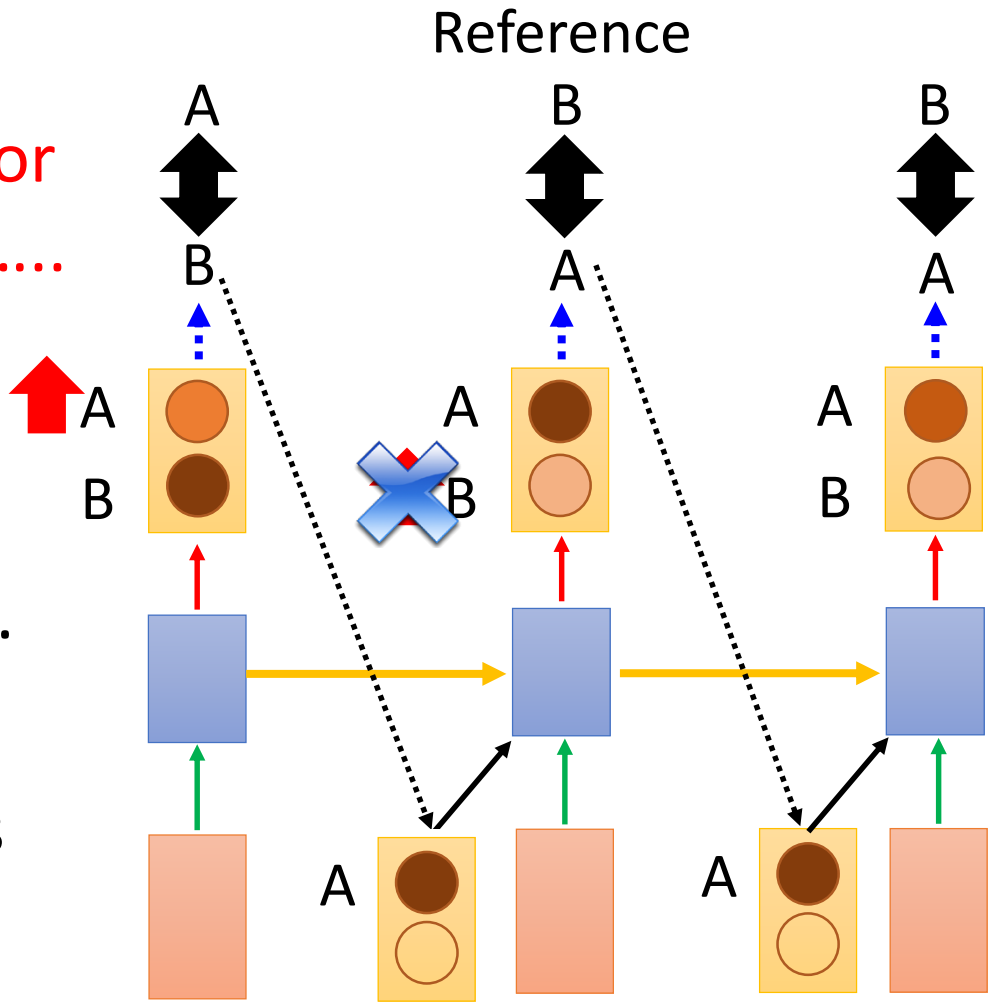
一步錯，步步錯

Modifying Training Process?

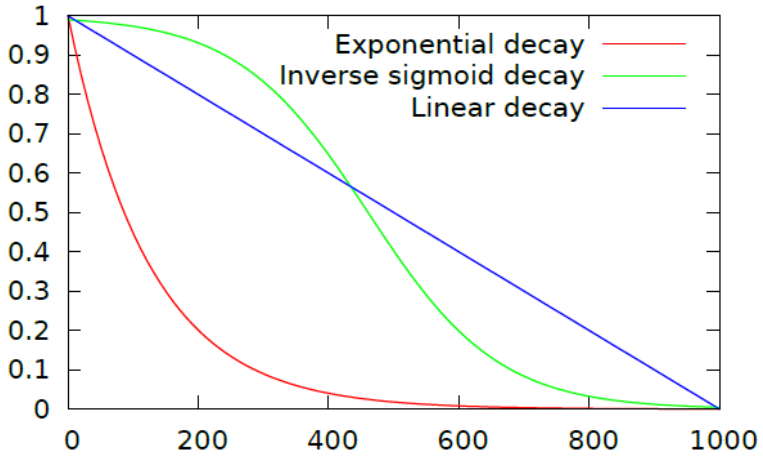
When we try to decrease the loss for both step 1 and 2 …..

Training is matched to testing.

In practice, it is hard to train in this way.



Scheduled Sampling



Scheduled Sampling

- Caption generation on MSCOCO

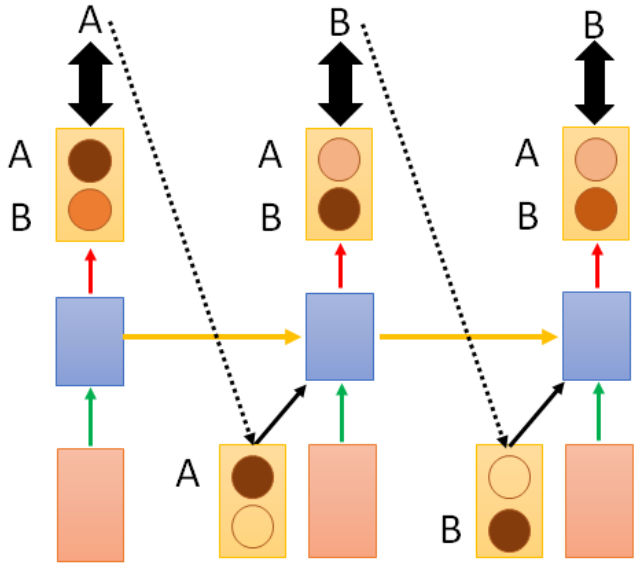
	BLEU-4	METEOR	CIDER
Always from reference	28.8	24.2	89.5
Always from model	11.2	15.7	49.7
Scheduled Sampling	30.6	24.3	92.1

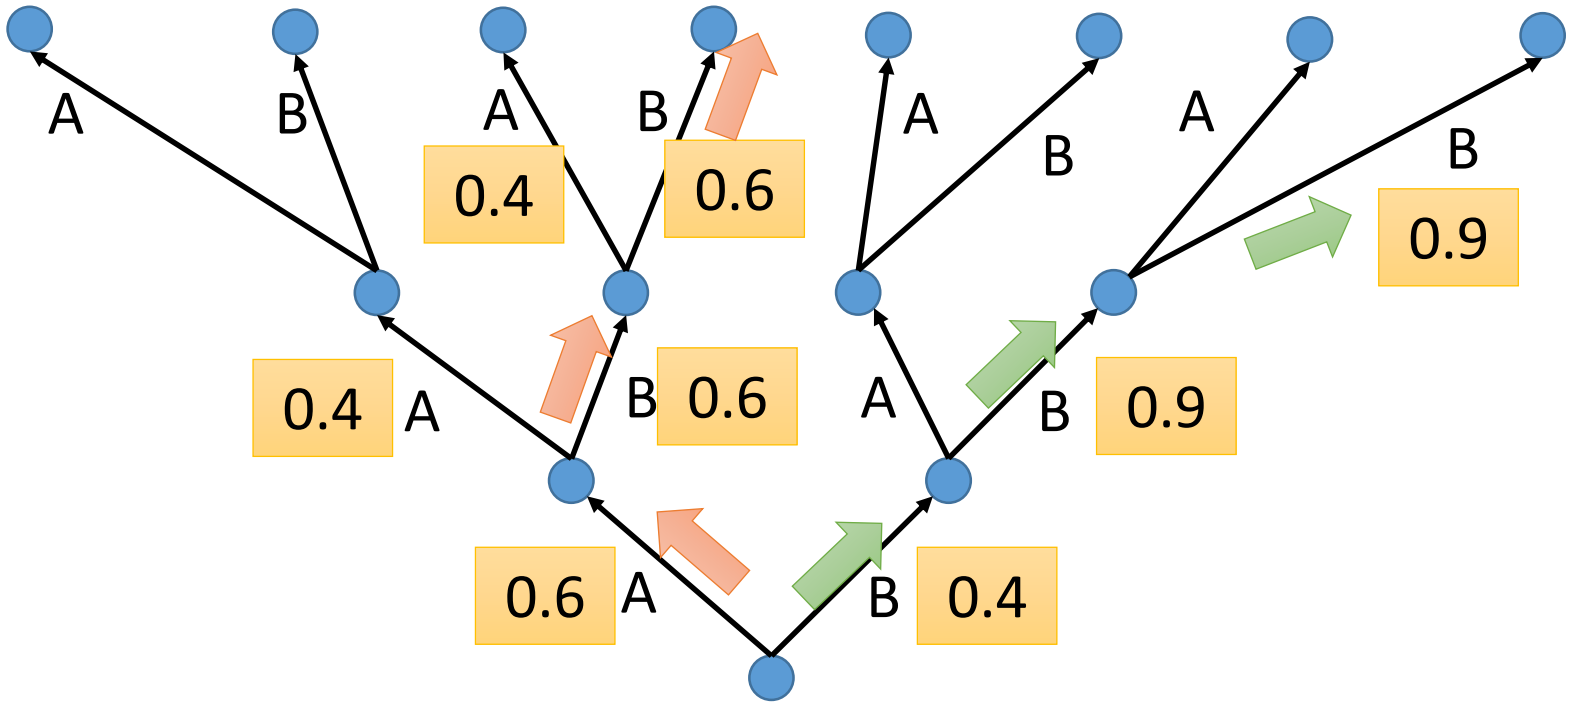
Samy Bengio, Oriol Vinyals, Navdeep Jaitly, Noam Shazeer, Scheduled Sampling for Sequence Prediction with Recurrent Neural Networks, arXiv preprint, 2015

Beam Search

The green path has higher score.

Not possible to check all the paths

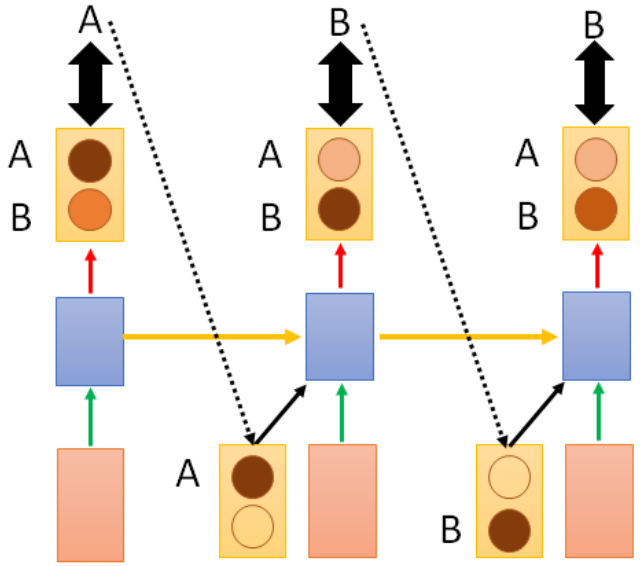


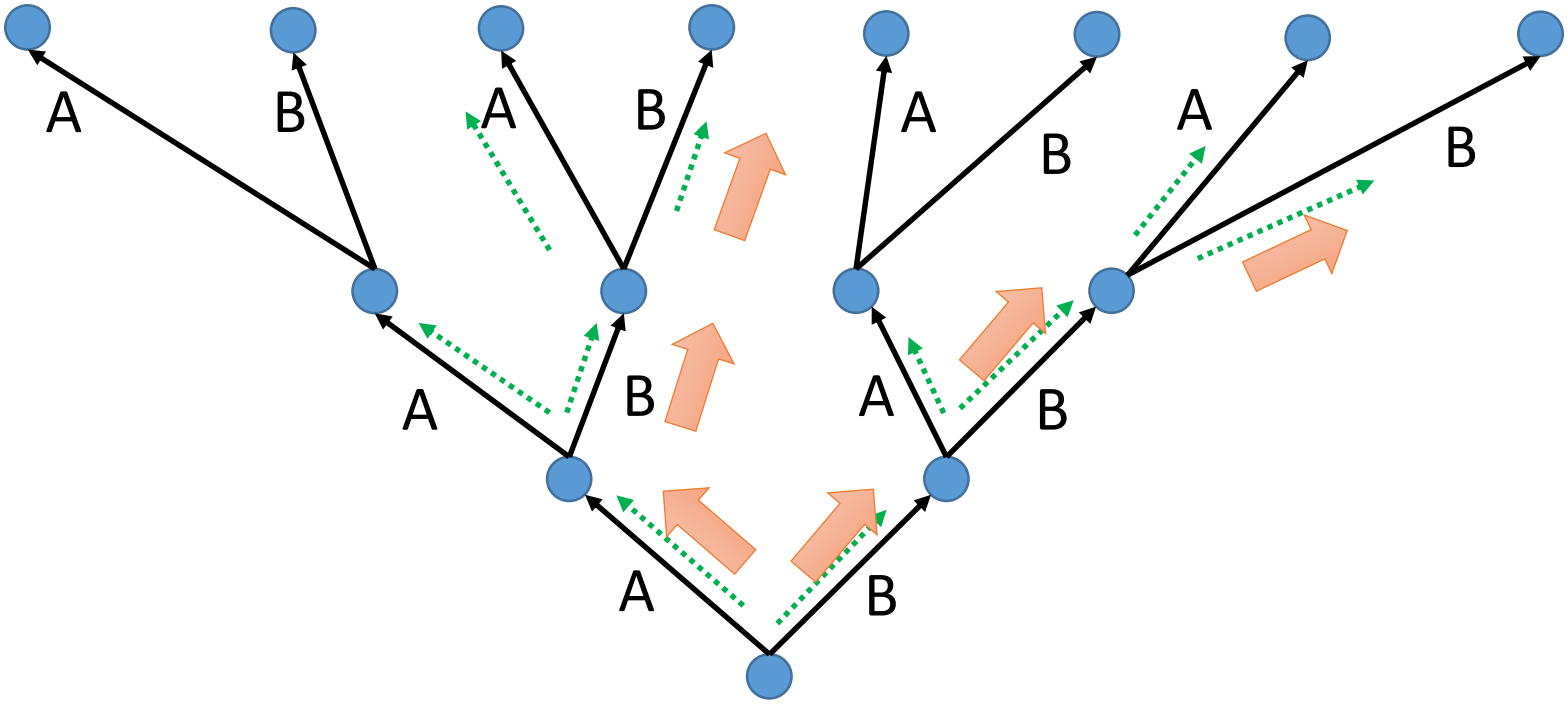


Beam Search

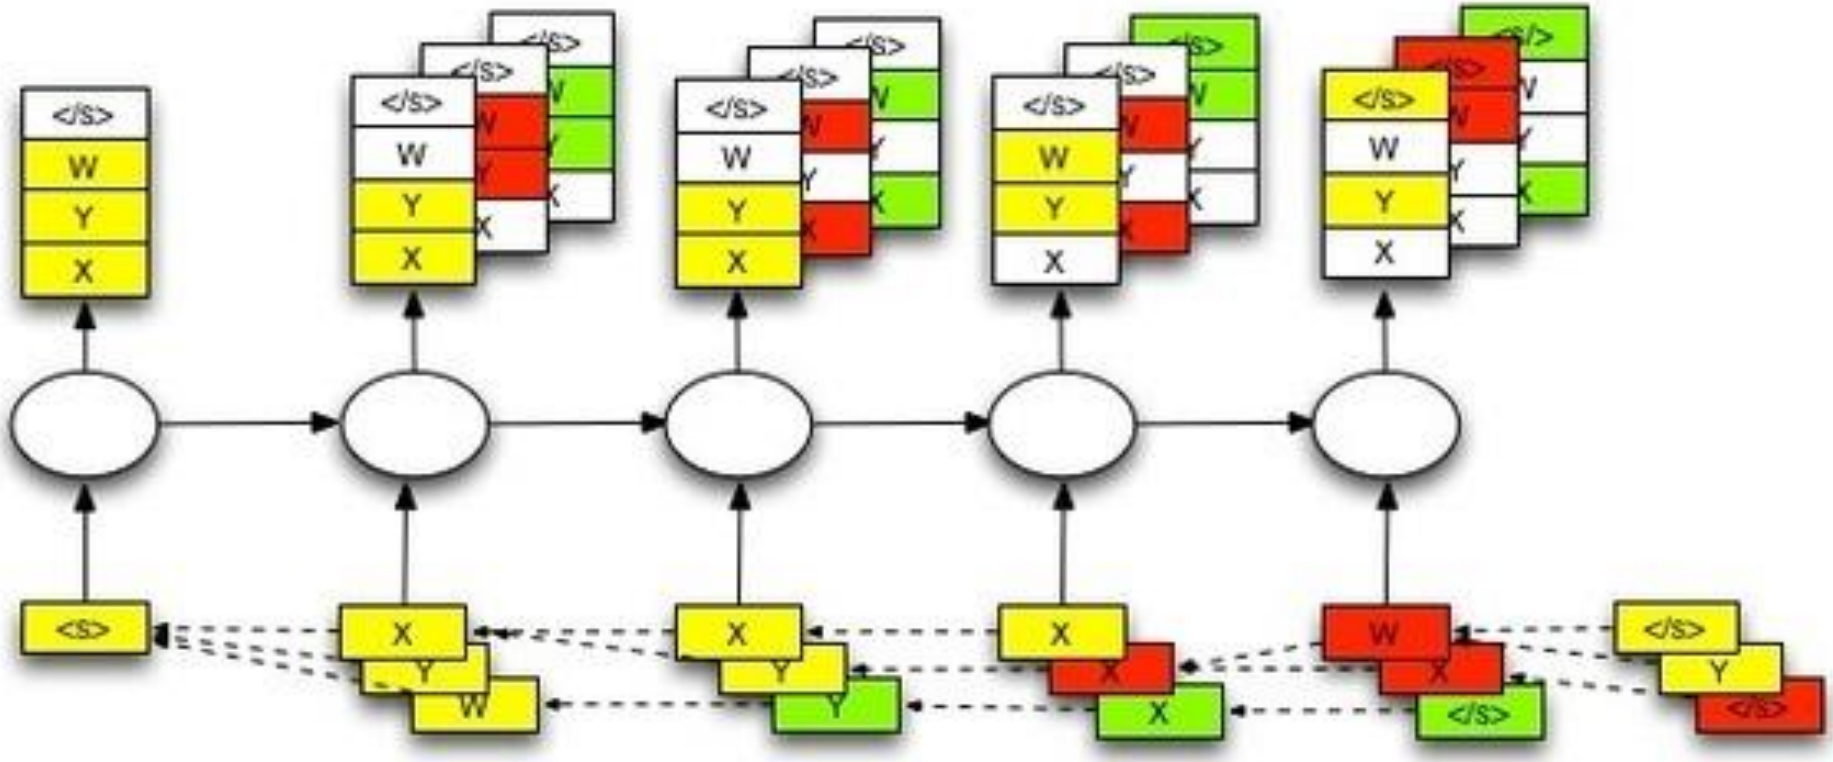
Keep several best path at each step

Beam size = 2





Beam Search



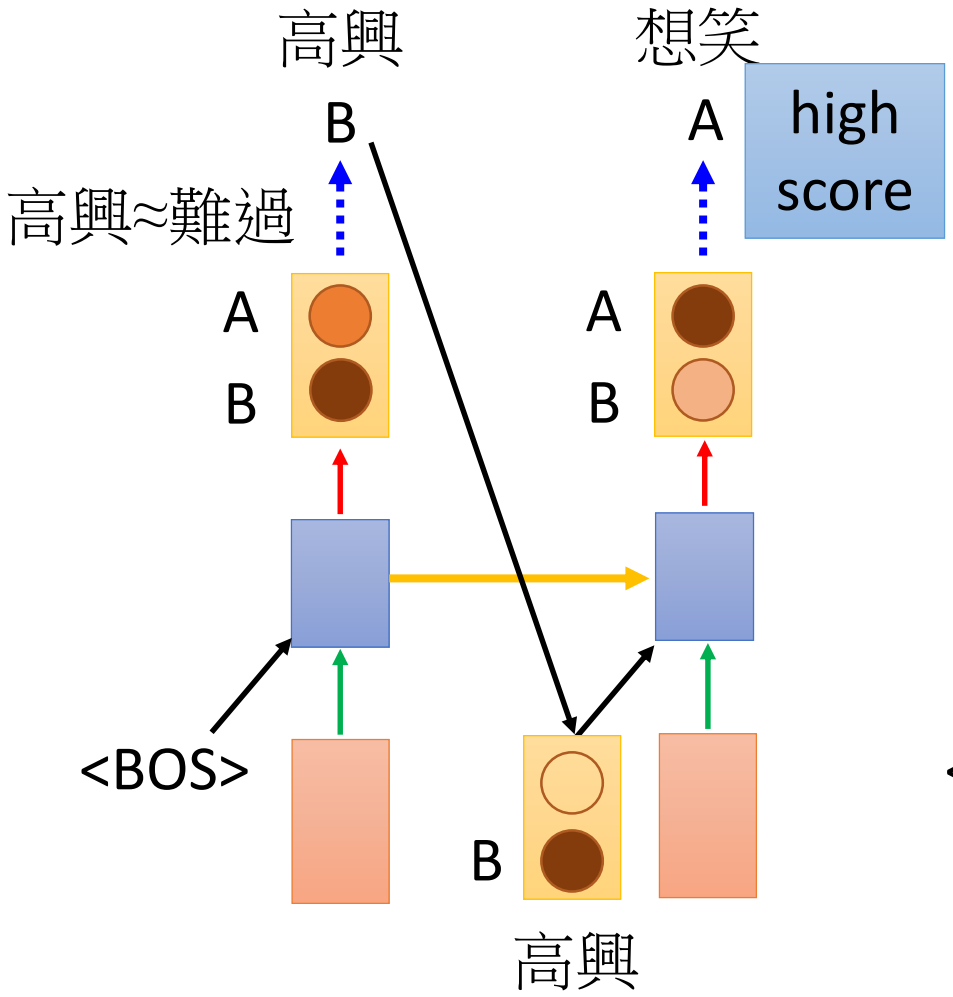
The size of beam is 3 in this example.

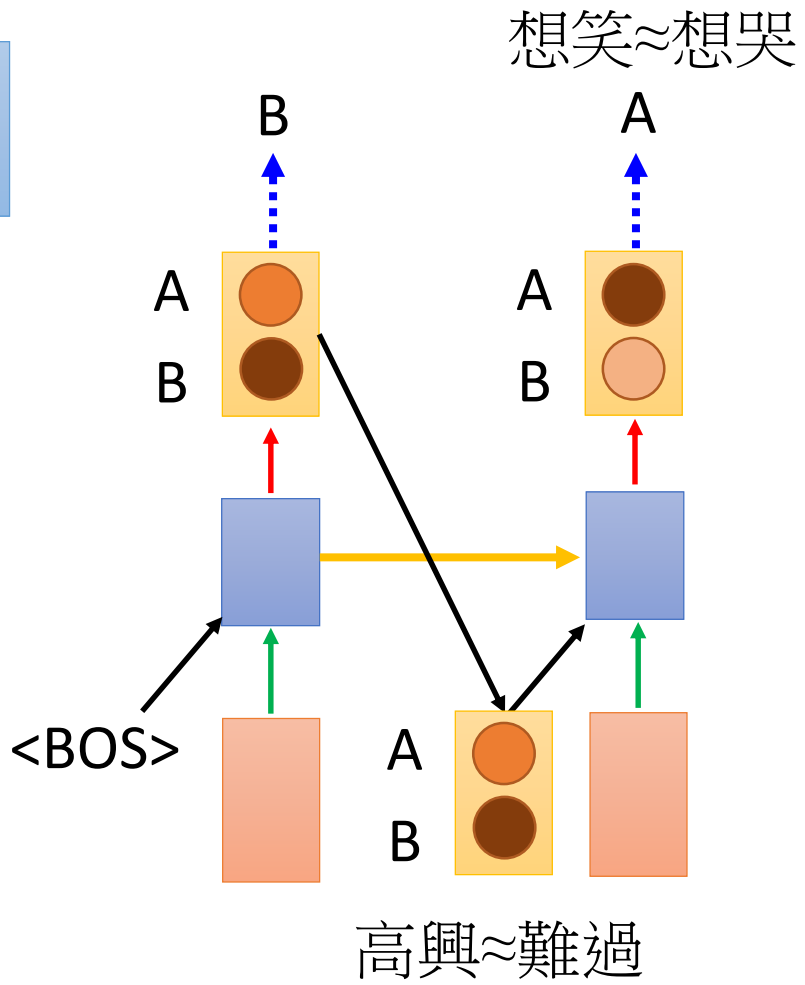
https://github.com/tensorflow/tensorflow/issues/654#issuecomment-169009989

Better Idea?

U: 你覺得如何?

M: 高興想笑 or 難過想哭





Object level v.s. Component level

- Minimizing the error defined on component level is not equivalent to improving the generated objects

Ref: The dog is running fast

$$C = \sum_t C_t$$

Cross-entropy of each step

Optimize object-level criterion instead of component-level cross-entropy.

object-level criterion: $R(y, \hat{y})$

Gradient Descent?

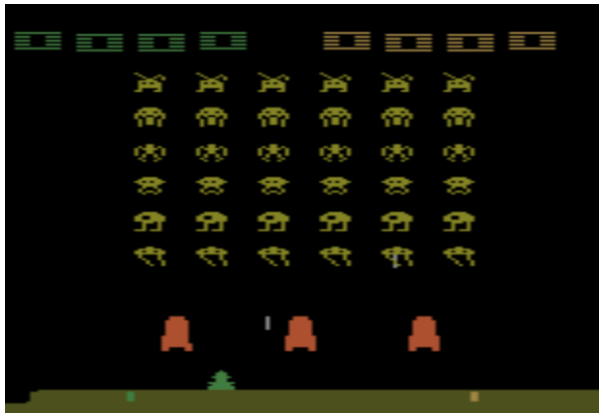
y: generated utterance, $\hat{y}$: ground truth

Reinforcement learning?

Start with observation s_1

Observation s_2

Observation s_3



Obtain reward $r_1 = 0$

Action a_1: "right"

Obtain reward $r_2 = 5$

Action a_2 : "fire"

(kill an alien)
